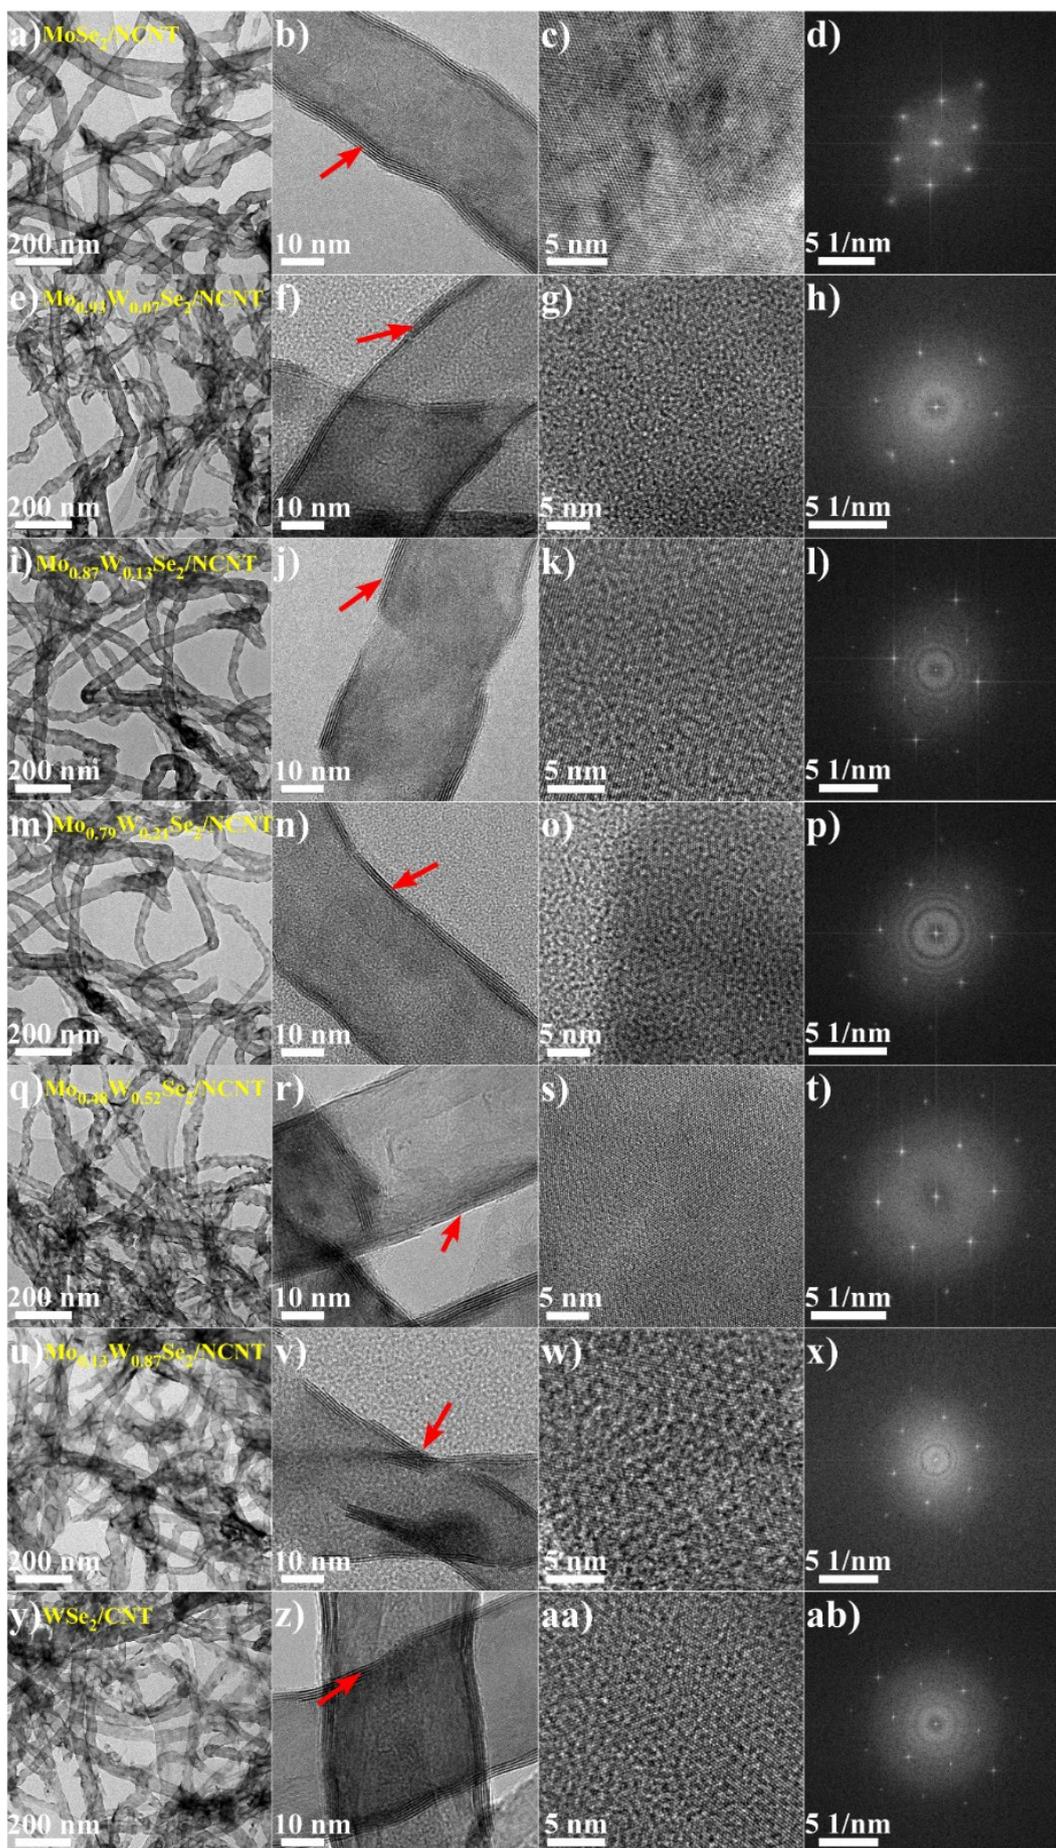

Figure S1. TEM results of $\text{Mo}_{(1-x)}\text{W}_x\text{Se}_2$ crystals on MWCNT. a, e, i, m, q, u, y) Low-resolution TEM image of $\text{Mo}_{(1-x)}\text{W}_x\text{Se}_2$ nanocrystals on MWCNT with x of 0, 0.07, 0.13, 0.21, 0.52, 0.87 and 1, respectively. **b, f, j, n, r, v, z)** corresponding close-up TEM images of $\text{Mo}_{(1-x)}\text{W}_x\text{Se}_2$ nanocrystals grown on MWCNT. The nanocrystals are pointed out by red arrows. **c, g, k, o, s, w, aa)** High-resolution TEM (HRTEM) images of the basal plane of corresponding $\text{Mo}_{(1-x)}\text{W}_x\text{Se}_2$ nanocrystals. **d, h, l, p, t, x, ab)** the FFT pattern of single-crystalline $\text{Mo}_{(1-x)}\text{W}_x\text{Se}_2$ nanocrystals.

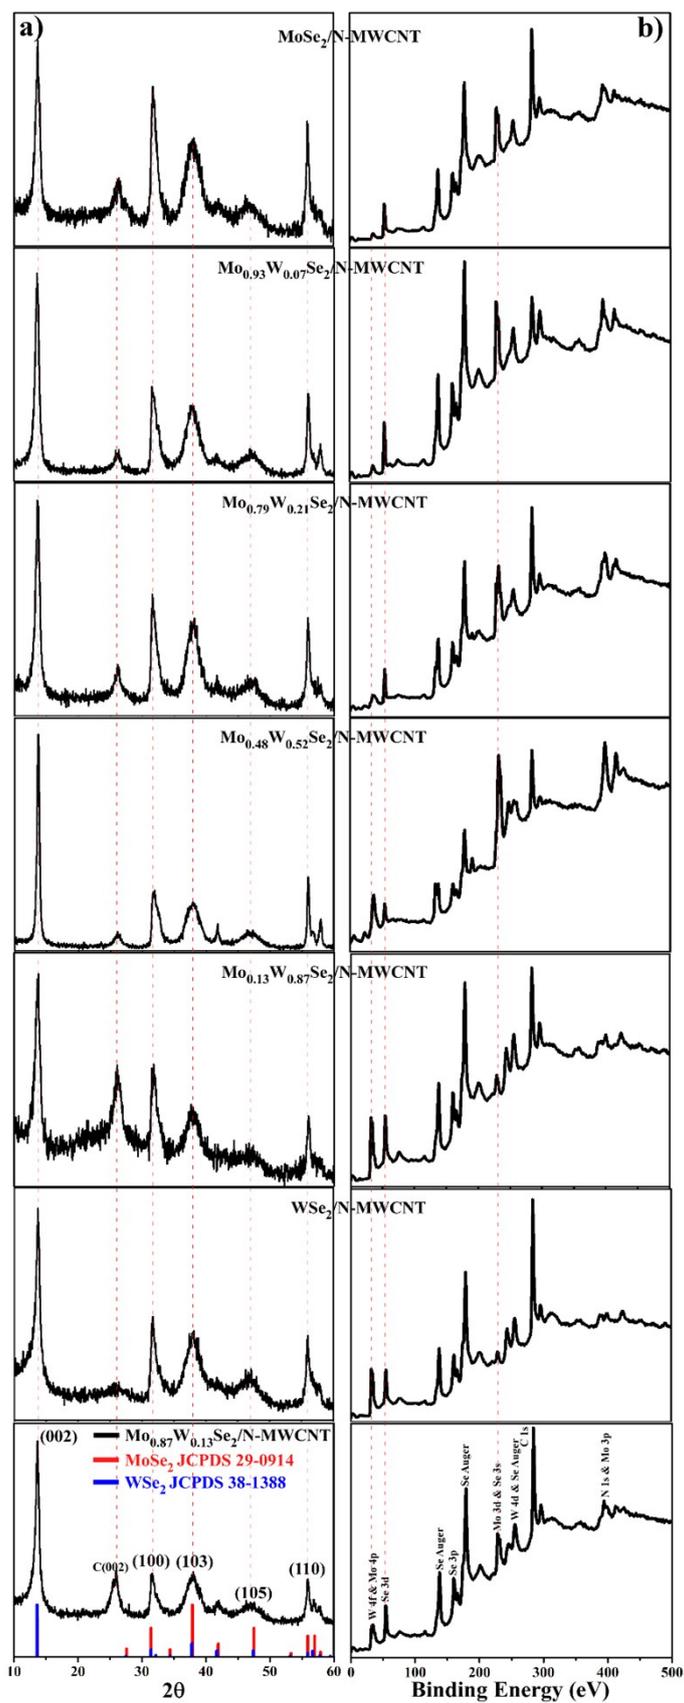

Figure S2. a) XRD and b) XPS spectra of Mo_(1-x)W_xSe₂/N-MWCNT with various W composition x from 0 to 1.

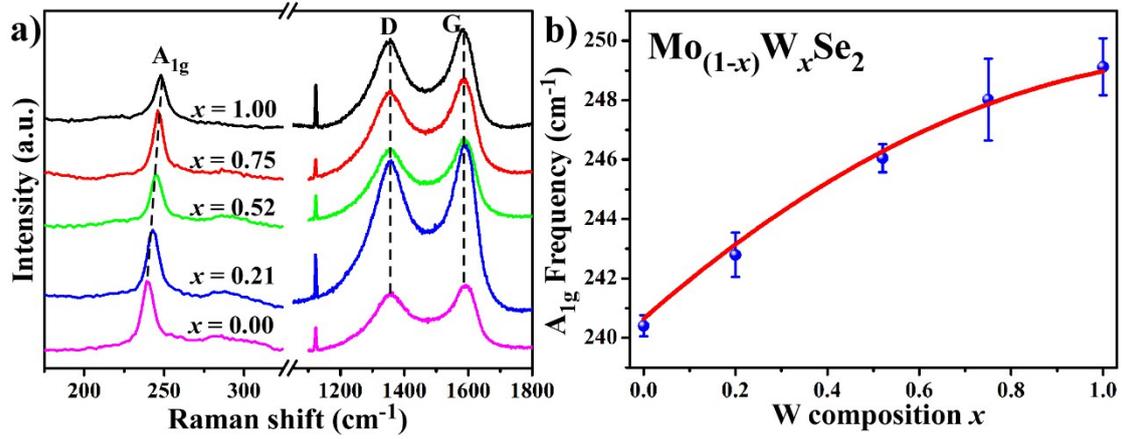

Figure S3. Raman spectra of $\text{Mo}_{(1-x)}\text{W}_x\text{Se}_2/\text{N-MWCNT}$ with various W composition x . a) Raman spectra of $\text{Mo}_{(1-x)}\text{W}_x\text{Se}_2/\text{N-MWCNT}$ with x from 0 to 1. The A_{1g} peak shift is guided by dotted line, while the D and G peaks of reduced graphene oxide keep at the same position. b) Plots of A_{1g} frequencies versus W composition x , the blue dots represent experimental data and the red line as the fitting trend. The excitation laser wavelength is 514 nm and all the spectra are calibrated with the 520 cm^{-1} Raman peak from pure SiO_2/Si substrate.

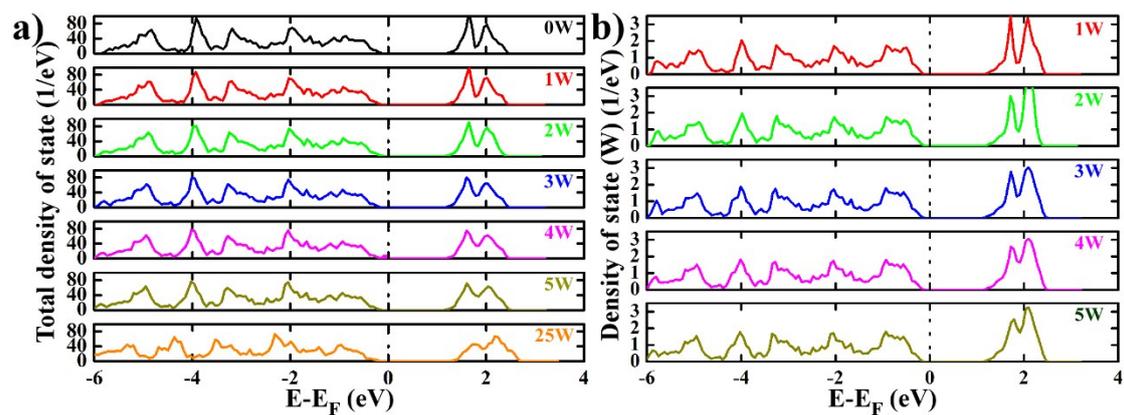

Figure S4. Density of state results of $\text{Mo}_{(1-x)}\text{W}_x\text{Se}_2$ with various number of W atom doping. a) Total density of state results of crystals with different W concentration. **b)** The independent density of state curves of W atom in all crystals.

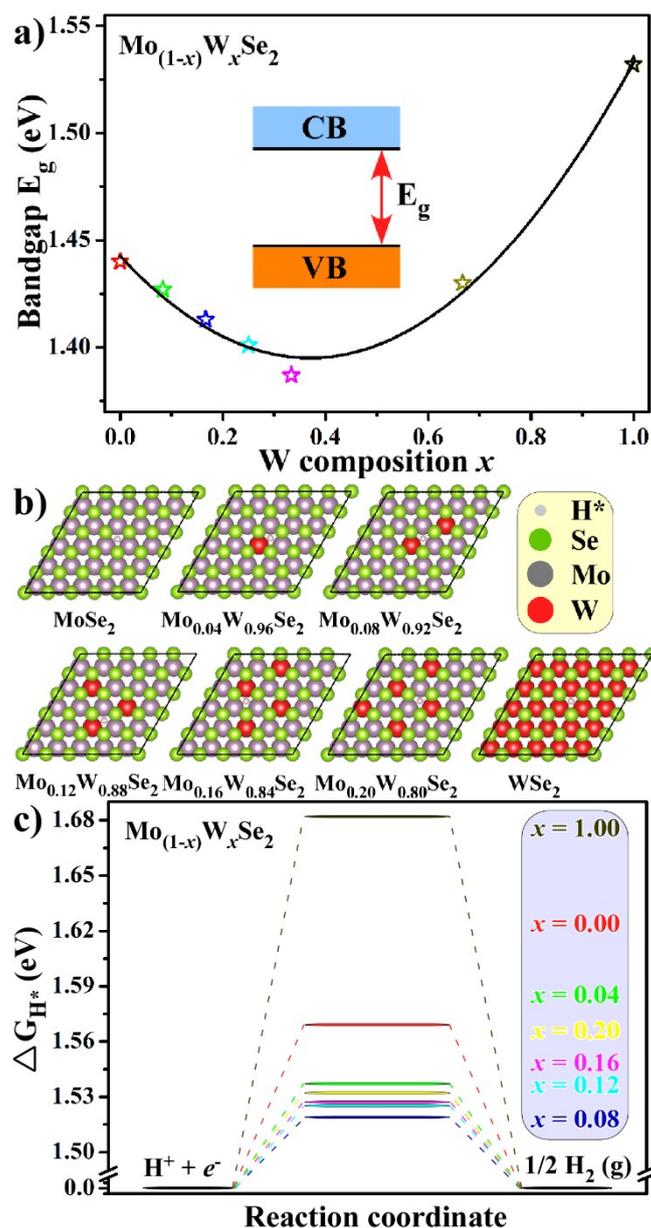

Figure S5. Density Functional Theory (DFT) calculation results. a) Bandgap E_g values of $\text{Mo}_{(1-x)}\text{W}_x\text{Se}_2$ crystals as a function of x . **b)** Structural models of $\text{Mo}_{(1-x)}\text{W}_x\text{Se}_2$ crystals with the adsorbed hydrogen atoms. The grey, red, green and white spheres represent Mo, W, Se and the adsorbed hydrogen atoms, respectively. **c)** Calculated Gibbs free energy diagram for HER on $\text{Mo}_{(1-x)}\text{W}_x\text{Se}_2$ basal planes with W composition x from 0 to 1.

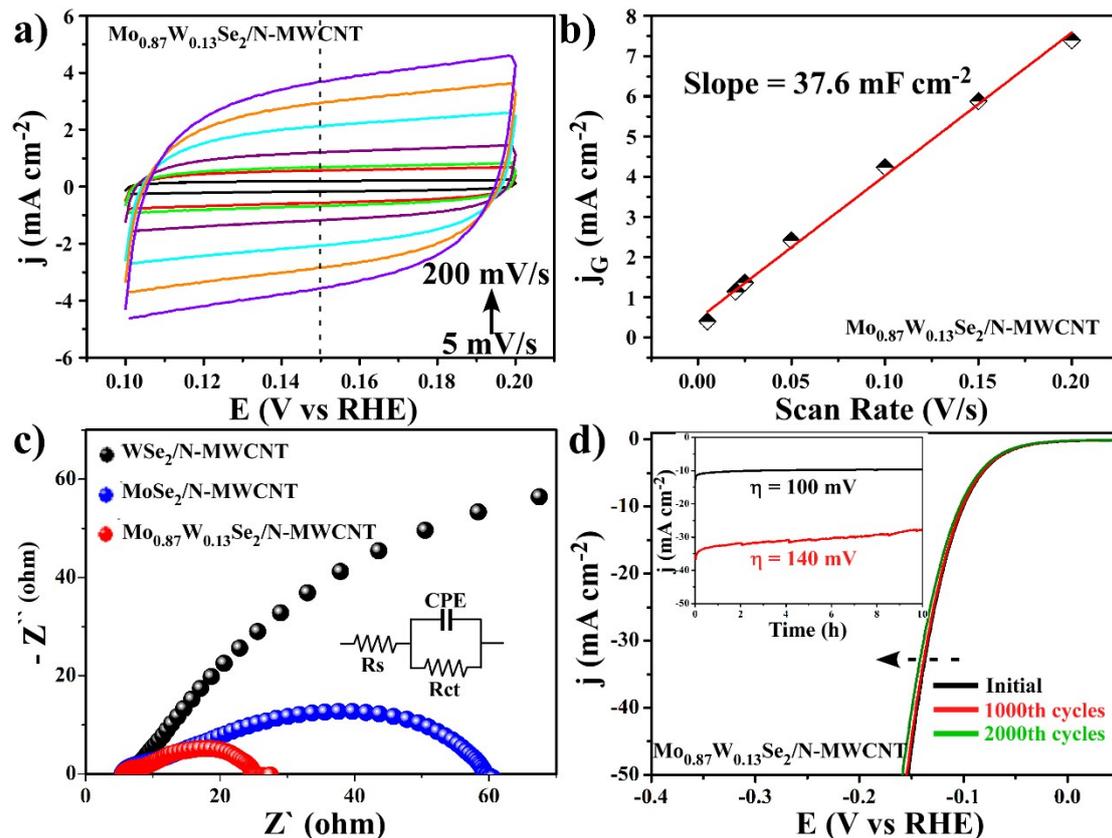

Figure S6. Electrochemical properties of $\text{Mo}_{0.87}\text{W}_{0.13}\text{Se}_2/\text{N-MWCNT}$ catalyst. **a)** Cyclic voltammograms within the range of non-faradaic reactions. **b)** Variation of double-layer charging currents at 0.15 V as a function of voltage scan rate. Symbols and solid line are experimental data from **c)** and the linear fitting. **c)** Nyquist plots of various catalysts loaded electrodes at the overpotential of 150 mV. **d)** Polarization curves of $\text{Mo}_{0.87}\text{W}_{0.13}\text{Se}_2/\text{N-MWCNT}$ after 1000 and 2000 cycles. Inset is the time dependence of cathodic current density during electrolysis at the overpotentials of 100 mV and 140 mV, respectively. *Noted here the $\text{Mo}_{0.87}\text{W}_{0.13}\text{Se}_2/\text{N-MWCNT}$ mass loading in **d)** is 2 mg cm^{-2} , more than the loading applied in array comparison, however it still exhibited high durability in long term testing, indicating that the $\text{Mo}_{0.87}\text{W}_{0.13}\text{Se}_2/\text{N-MWCNT}$ could be promising in practical applications.*

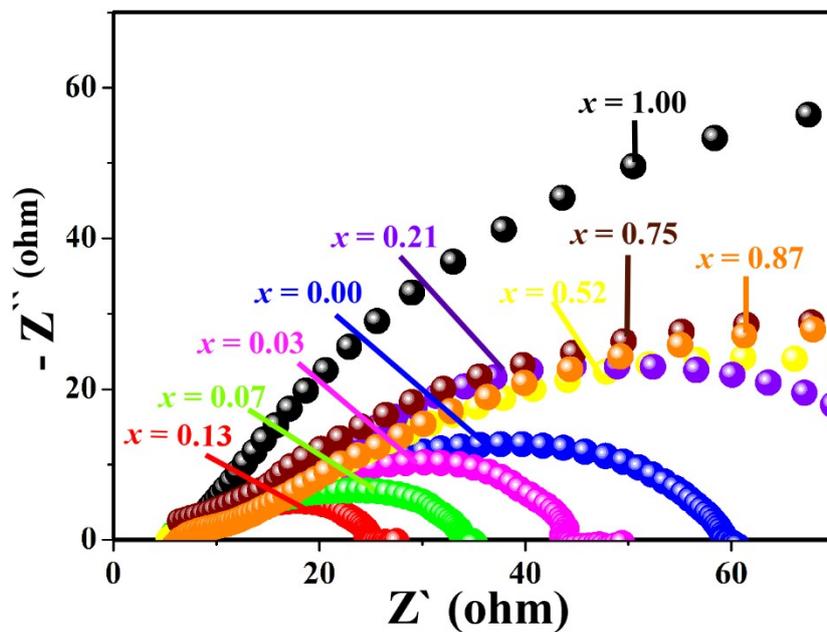

Figure S7. Nyquist plots of $\text{Mo}_{(1-x)}\text{W}_x\text{Se}_2/\text{N-MWCNT}$ catalysts loaded electrodes at the overpotential of 150 mV with different x from 0 to 1 in the same condition.

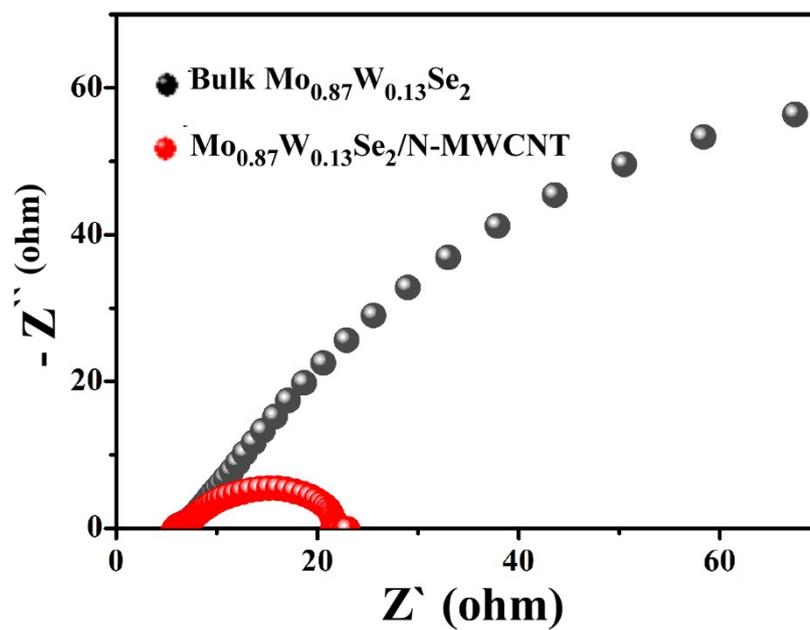

Figure S8. Nyquist plots of bulk $\text{Mo}_{0.87}\text{W}_{0.13}\text{Se}_2$ and $\text{Mo}_{0.87}\text{W}_{0.13}\text{Se}_2/\text{N-MWCNT}$ catalysts loaded electrodes at the overpotential of 150 mV in the same condition.

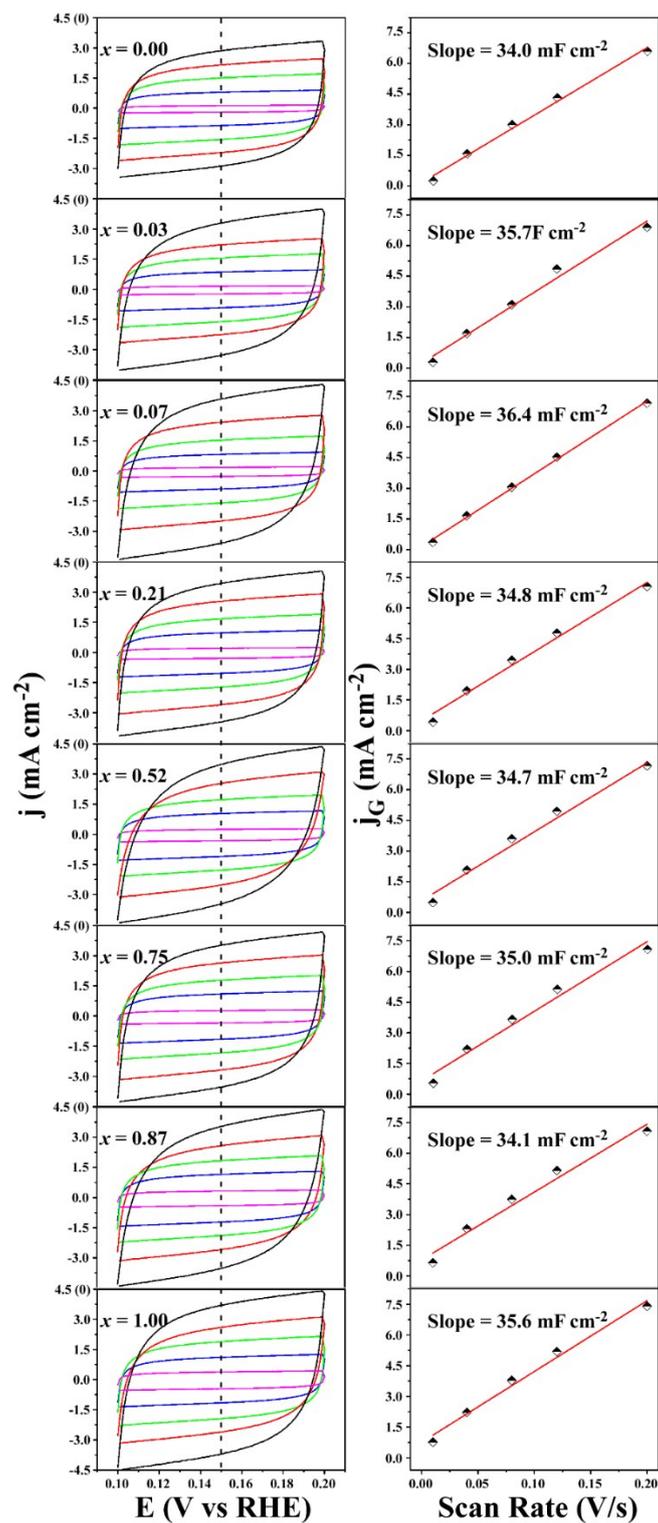

Figure S9. Cyclic voltammograms (CV) within the range of non-faradaic reactions of $\text{Mo}_{(1-x)}\text{W}_x\text{Se}_2/\text{N-MWCNT}$ with various W composition x , scan rate is from 5 to 200 mV, and corresponding variation of double-layer charging currents at 0.15 V as a function of voltage scan rate. Symbols and solid lines are experimental data and linear fitting, respectively.

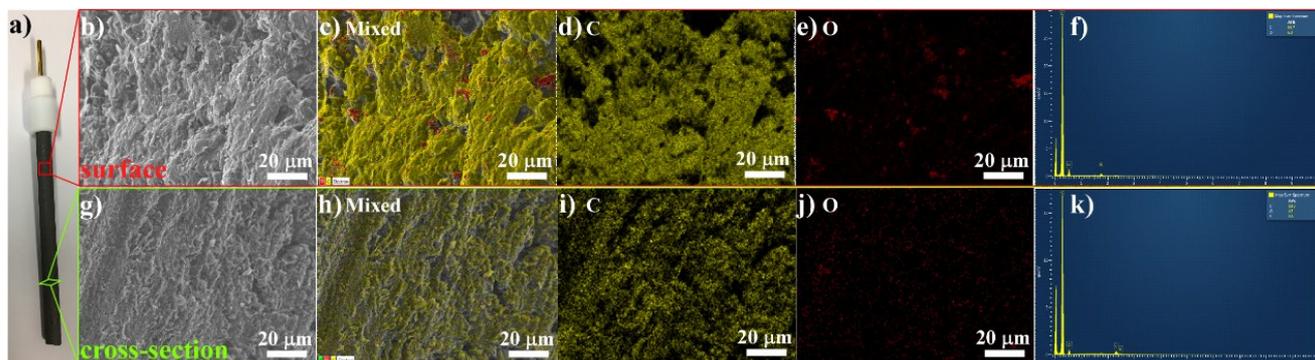

Figure S10. SEM images and EDS mapping results of carbon bar (counter electrode). **a)** photograph of carbon bar used as counter electrode in this work. **b)** SEM image of the carbon bar surface. Followed by **c)** mixed elemental mapping, **d)** carbon elemental mapping, **e)** oxygen elemental mapping and **f)** elemental percentage spectrum of the surface of carbon bar, C atom% is 93.7% and O atom% is 6.3%. **g)** SEM image of the cross-section of carbon bar. Followed by **h)** mixed elemental mapping, **i)** carbon elemental mapping, **j)** oxygen elemental mapping and **k)** elemental percentage spectrum of the cross-section of carbon bar, C atom% is 94.9%, O atom% is 4.5% and S atom% is 0.6%. There is no metal or other HER-active impurities in/on the carbon bar.

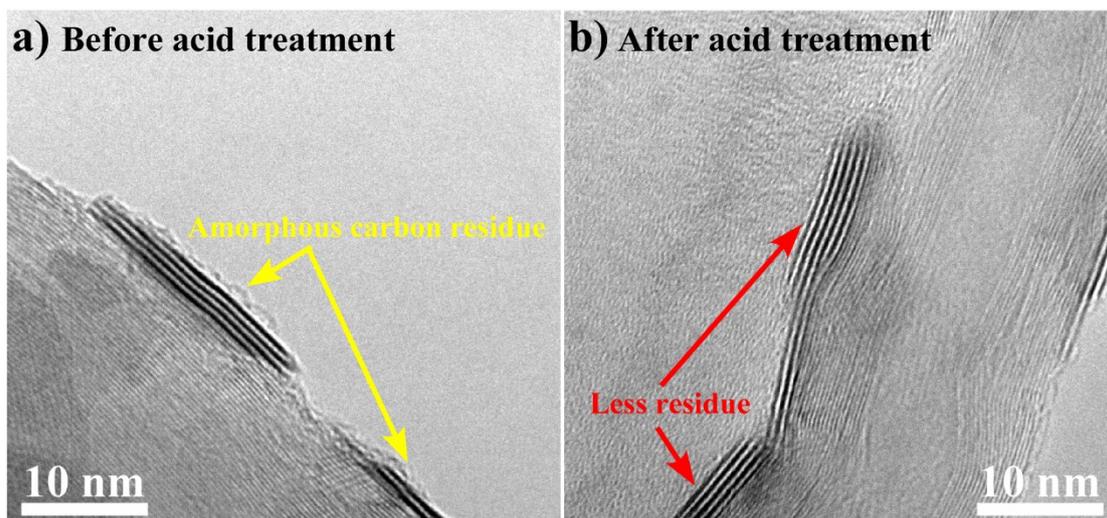

Figure S11. TEM images of $\text{Mo}_{(1-x)}\text{W}_x\text{Se}_2/\text{N-MWCNT}$ before and after acid treatment. a) Before acid treatment, there is some amorphous carbon residues around crystal surface. **b)** After acid treatment, the carbon residues become less and the surface of crystal is more smooth and clean.

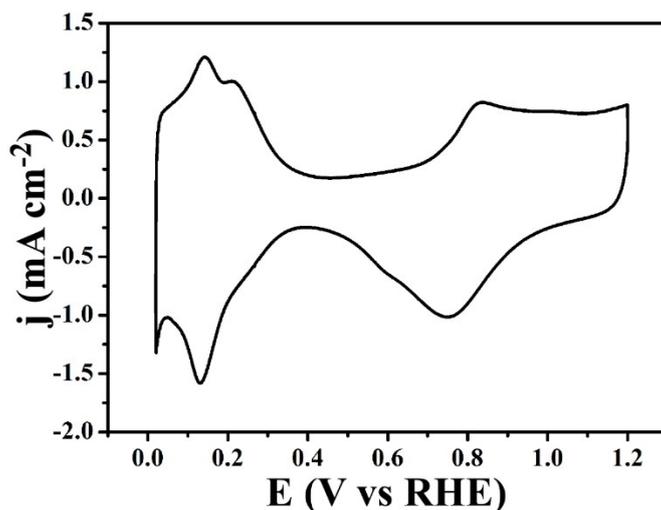

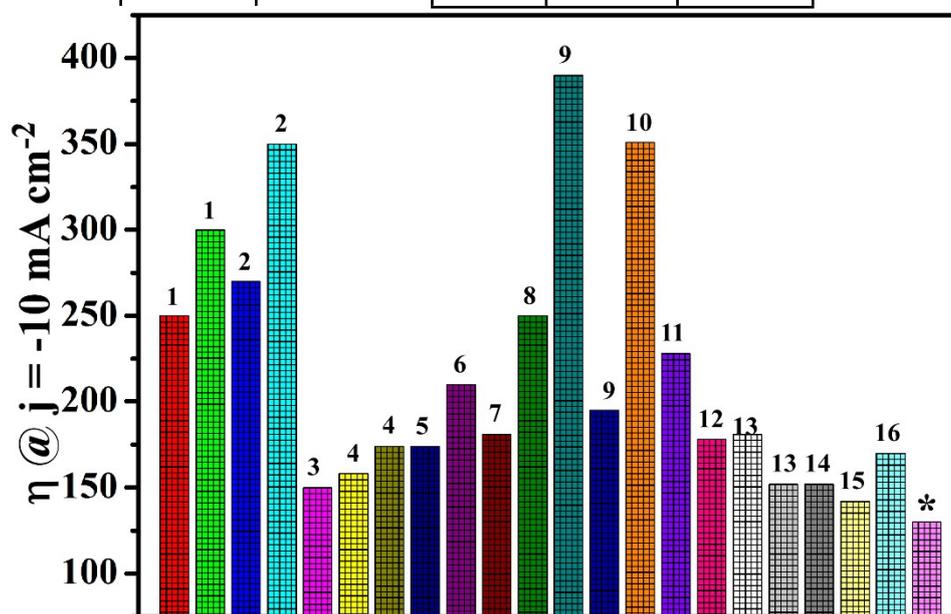

Figure S12. Fingerprint Cyclic Voltammetry Curve of Commercial Pt/C (46%, TEC10E50E, TKK) in Ar-saturated 0.1 M HClO₄ at a scan rate of 50 mV s⁻¹. For commercial Pt/C electrode preparation, 10 mg of Pt/C powder was ultrasonically dispersed in 5 mL of a 4:1 (v:v) water/2-propanol mixed solvents along with 20 μ L of Nafion solution for 15 min. 20 μ L of above suspension was deposited on a polished and clean glassy carbon (d = 5 mm) and dry naturally in the air for testing (mass loading is 0.2 mg cm⁻²). The calculated electrochemical surface area (ECSA) is \sim 60 m²/g_{Pt}.

Table S1. Recently reported Mo/W-based TMDs electrocatalysts towards hydrogen evolution reaction (HER) in 0.5 M H₂SO₄

<i>Catalyst</i>	<i>Synthesis Method</i>	<i>Mass Loading (mg cm⁻²)</i>	<i>Current Density j (mA cm⁻¹)</i>	<i>Overpotential at j (mV)</i>	<i>Tafel Slope (mV dec⁻¹)</i>	<i>Exchange Current Density (μA cm⁻²)</i>	<i>Ref.</i>
