### Cyclic voltammetry study of MoS<sub>2</sub> precursors.

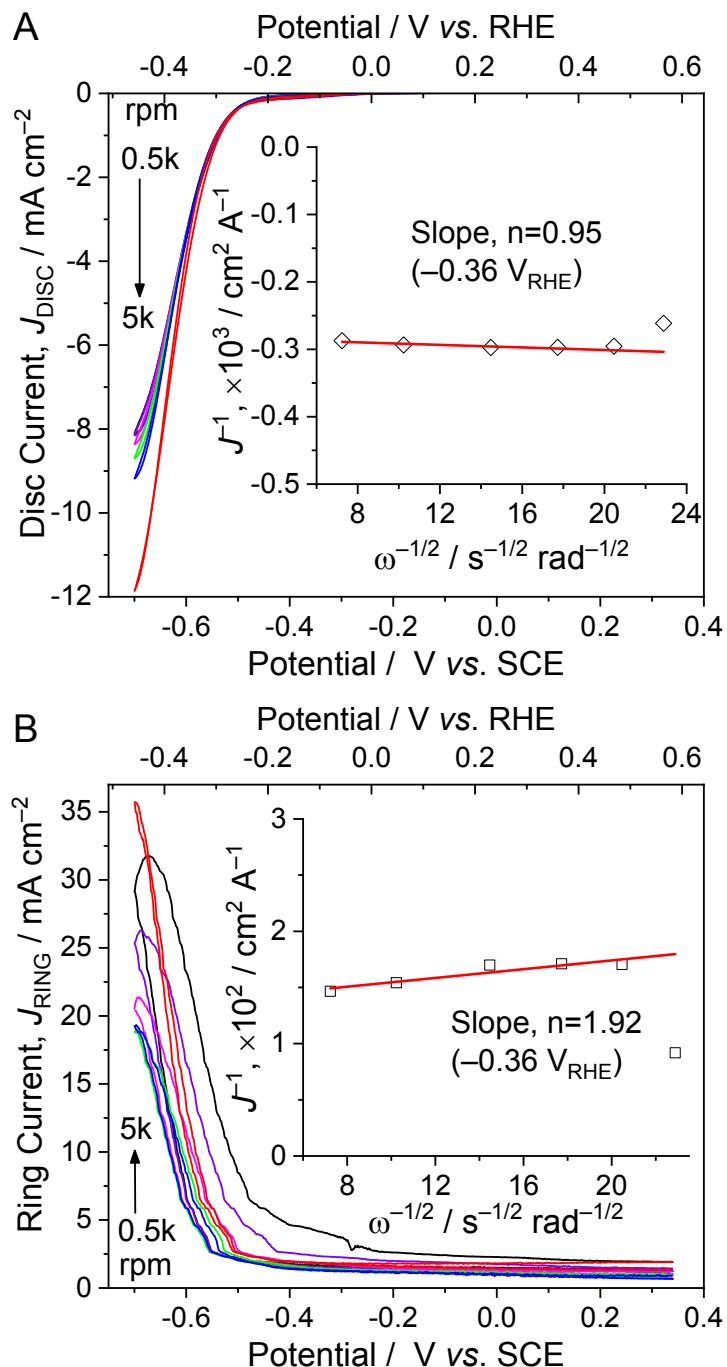

Prior to studying redox behaviour of MoS<sub>2</sub> precursors, the ferrocenium/ferrocene (Fc<sup>+</sup>/Fc) couple was used as an internal standard for calibration of the electrochemistry set-up. The cyclic voltammogram ([Figure S1](#)) of ferrocene in DMF reveals the occurrence of Fc<sup>+</sup>/Fc couple at +0.477 V vs. Ag/AgCl. The cyclic voltammograms of both [NH<sub>4</sub>]<sub>2</sub>[Mo<sub>3</sub>S<sub>13</sub>] and [Mo<sub>3</sub>S<sub>7</sub>(S<sub>2</sub>CNR<sub>2</sub>)]<sup>+</sup>I<sup>-</sup> (R = Me or Et) in anhydrous *N,N*-dimethylformamide display strong similarity to one another ([Figure S2](#)). All of them show an irreversible feature at ~−0.75 V vs. Ag/AgCl followed by a reversible reduction at approximately −1.32 V. The dithiocarbamate clusters show an additional irreversible wave upon scanning to ~−1.92 V, which is not apparent in the voltammogram of [NH<sub>4</sub>]<sub>2</sub>[Mo<sub>3</sub>S<sub>13</sub>]. None of the complexes supports any reversible process in the anodic direction. An electrochemical study of [NH<sub>4</sub>]<sub>2</sub>[Mo<sub>3</sub>S<sub>13</sub>] in CH<sub>2</sub>Cl<sub>2</sub> by Garriga, Llusar and coworkers revealed reductions at −1.03 V and −1.27 V ([Cp<sub>2</sub>Fe]<sup>+</sup>/[Cp<sub>2</sub>Fe] at + 0.44 V) but no satisfactory explanation about the reversibility of these processes was provided.<sup>1</sup> The irreversibility observed for the first cathodic process may be attributed to transformation of bridging S<sub>2</sub><sup>2-</sup> ligand to bridging monosulfide, S<sup>2-</sup>, by extrusion of elemental sulphur from the equatorial positions. This interpretation is suggested by calculations showing the LUMO of [Mo<sub>3</sub>S<sub>13</sub>]<sup>2-</sup> to be predominantly a σ\* character between sulphur *p* orbitals of the bridging S<sub>2</sub><sup>2-</sup> ligands.<sup>2</sup> The initial reductions observed for [Mo<sub>3</sub>S<sub>7</sub>(S<sub>2</sub>CNR<sub>2</sub>)]<sup>+</sup>I<sup>-</sup> (R = Me or Et) are notably similar to that in [Mo<sub>3</sub>S<sub>13</sub>]<sup>2-</sup> both in approximate potentials and qualitative appearance. Thus, the essential basis for irreversibility is likely the same as in [Mo<sub>3</sub>S<sub>13</sub>]<sup>2-</sup>. The reversible following reductions found both in [Mo<sub>3</sub>S<sub>13</sub>]<sup>2-</sup> and [Mo<sub>3</sub>S<sub>7</sub>(S<sub>2</sub>CNR<sub>2</sub>)]<sup>+</sup>I<sup>-</sup> (R = Me or Et) are tentatively assigned to reduction of the [Mo<sub>3</sub>S<sub>4</sub>]<sup>n</sup> core.

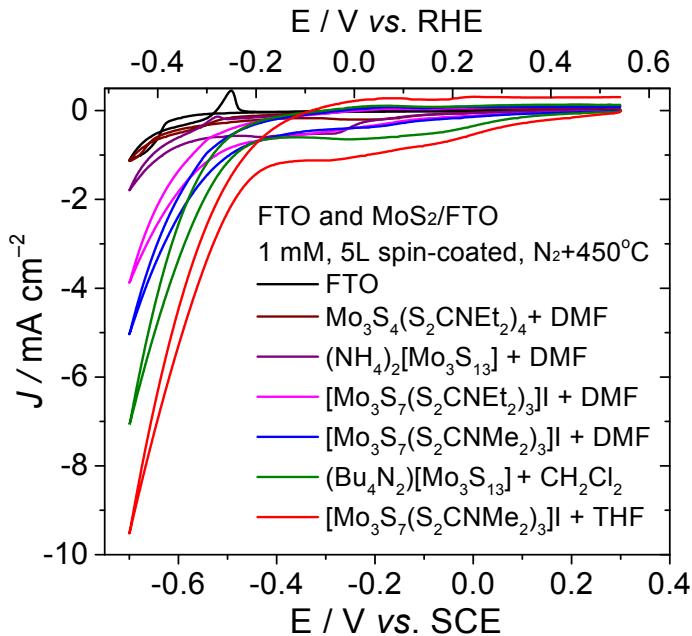

**Figure S1.** Cyclic voltammogram of ferrocene in DMF showing a ferrocenium/ferrocene couple at +0.477 V vs. Ag/AgCl.

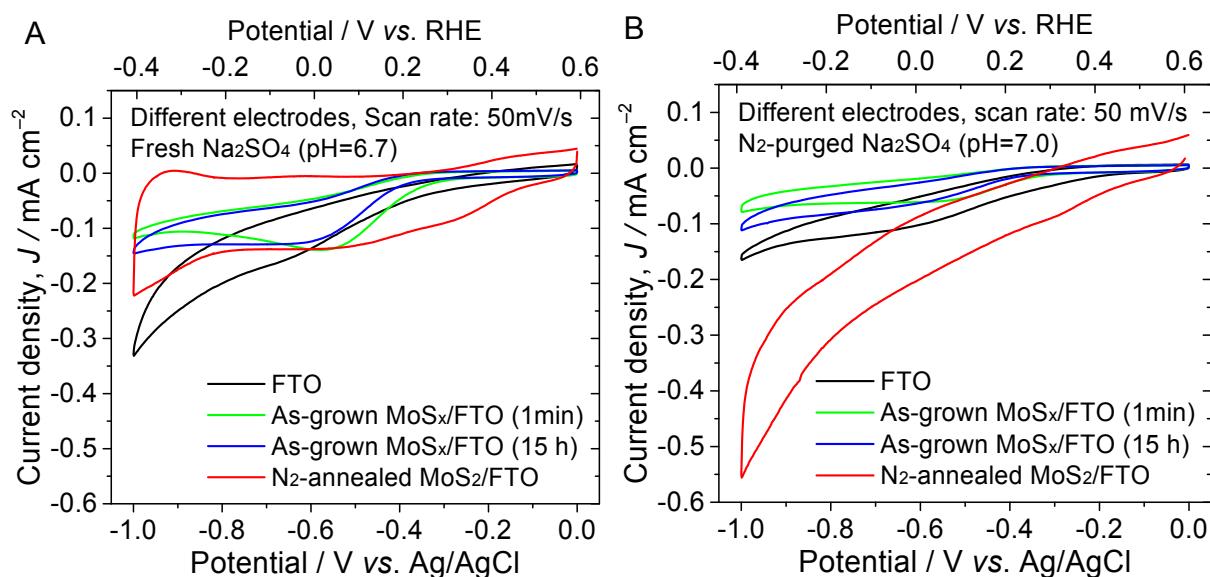

**Figure S2.** Cyclic voltammograms of (A)  $[Mo_3S_7(S_2CNEt_2)_3]I$ , (B)  $[Mo_3S_7(S_2CNMe_2)_3]I$ , and (C)  $[NH_4]_2[Mo_3S_{13}]$  in anhydrous DMF. Insets show their corresponding structures.

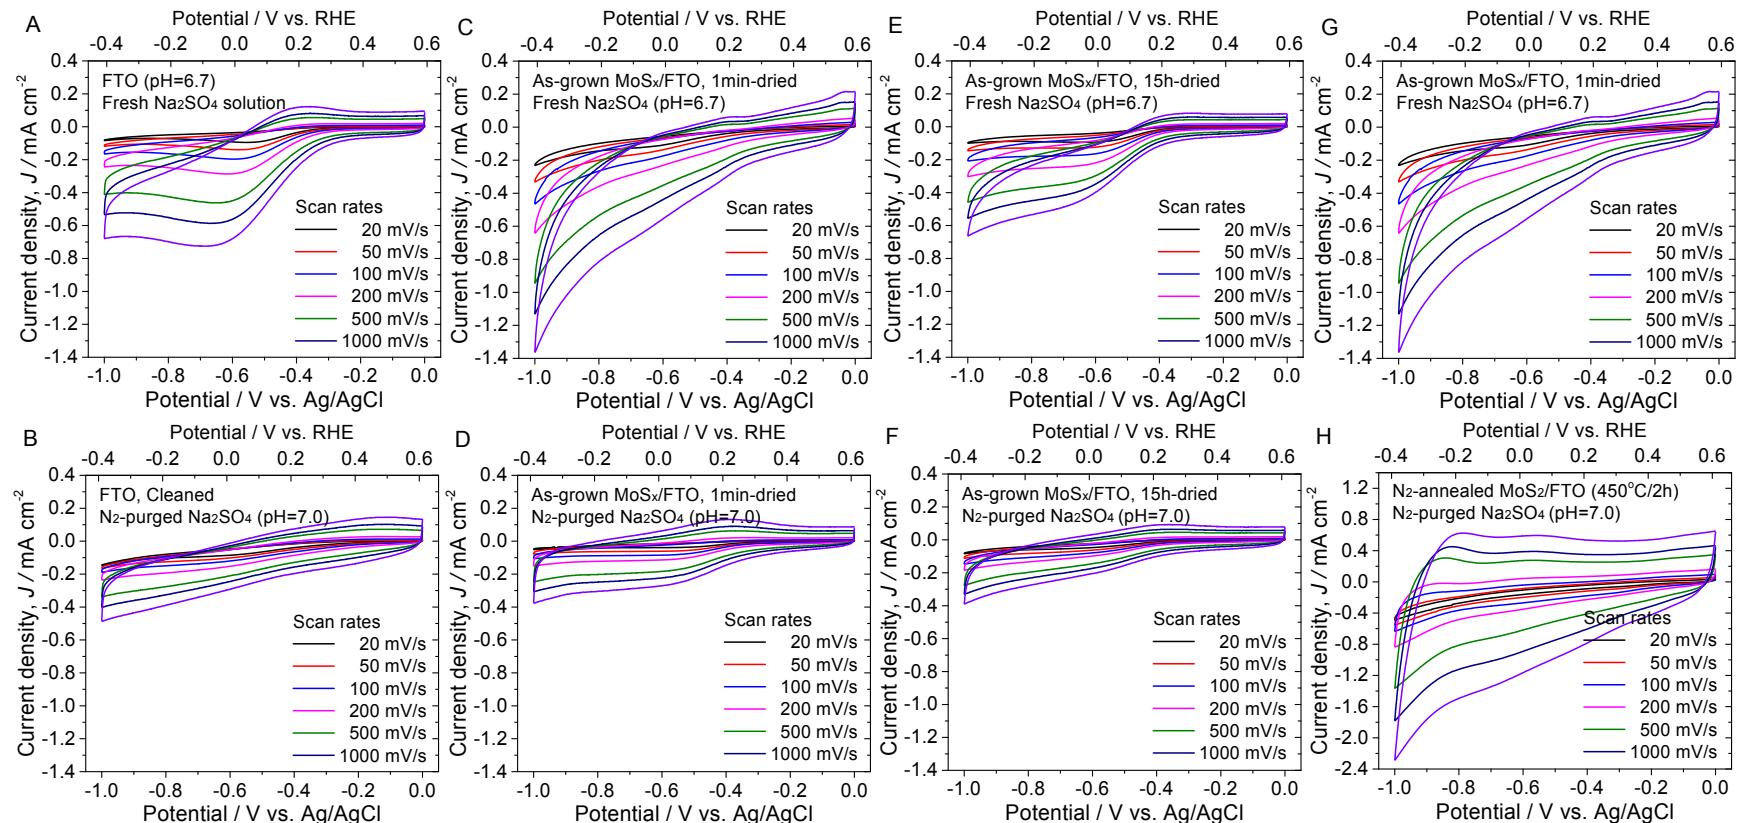

**Figure S3.** Polarization curves of MoS<sub>2</sub> recorded at (A) disc and (B) ring electrodes at different rotation speeds (viz. 500 to 5000 rpm). Insets show the Koutecky–Levich plots constructed at  $-0.36 \text{ V}$  vs. RHE over the entire rotation frequency range at both disc and ring electrodes. Scan rate:  $50 \text{ mV s}^{-1}$ ; Electrolyte:  $0.5 \text{ M H}_2\text{SO}_4$ .

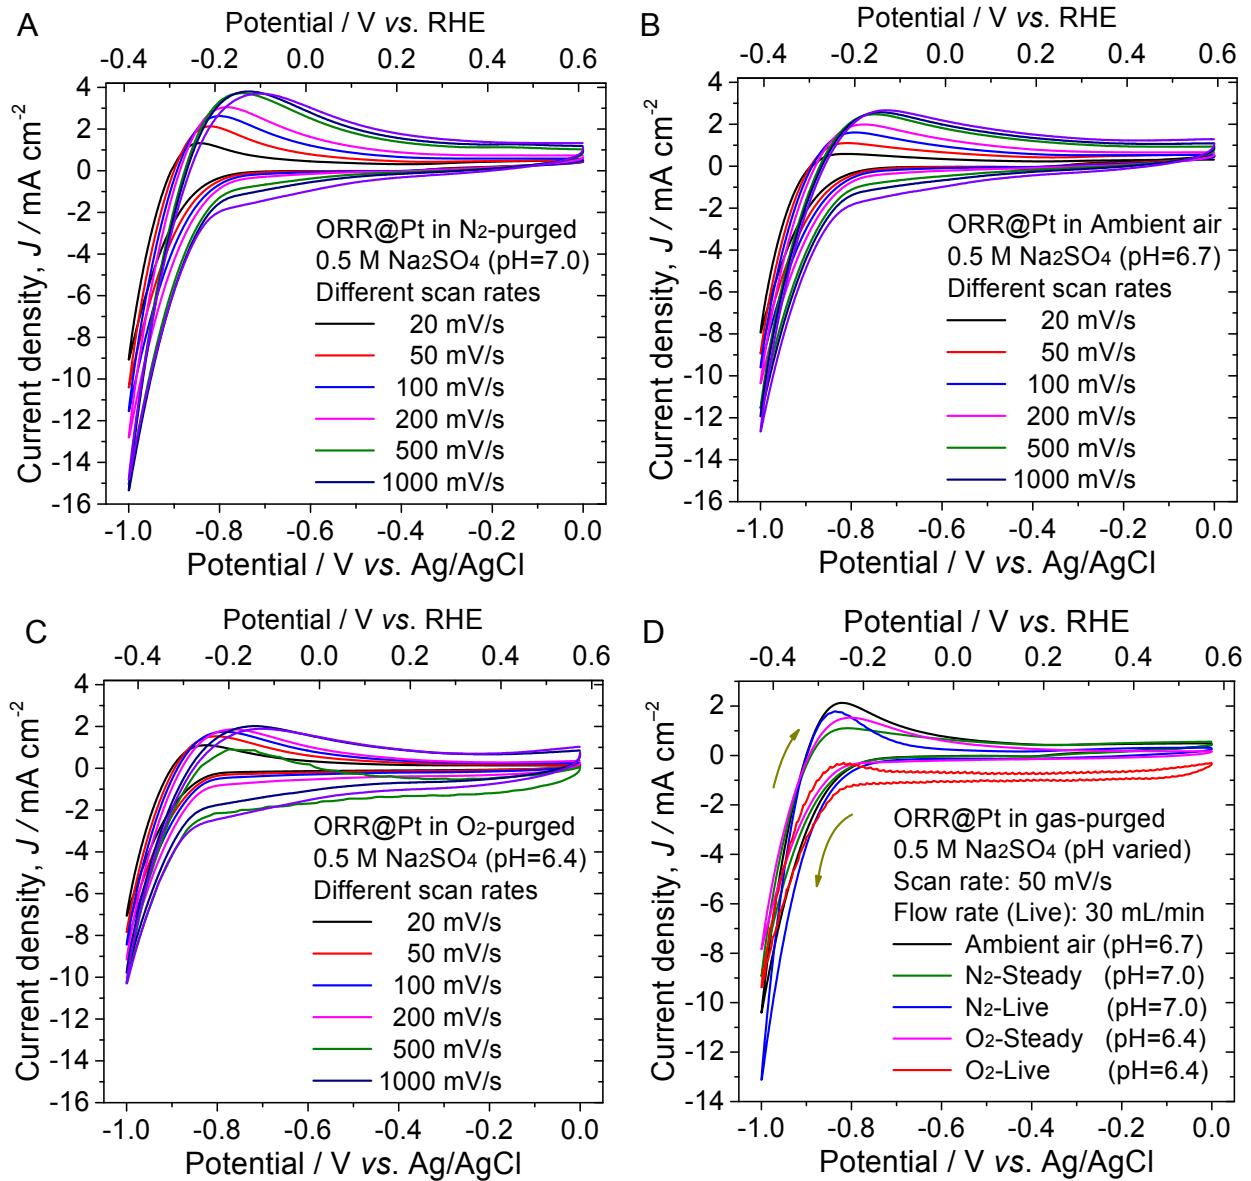

**Figure S4.** Polarization curves of MoS<sub>2</sub>/FTO electrodes fabricated at 450°C in nitrogen environment. Scan rate: 50 mV s<sup>-1</sup>; Electrolyte: 0.5 M H<sub>2</sub>SO<sub>4</sub>.

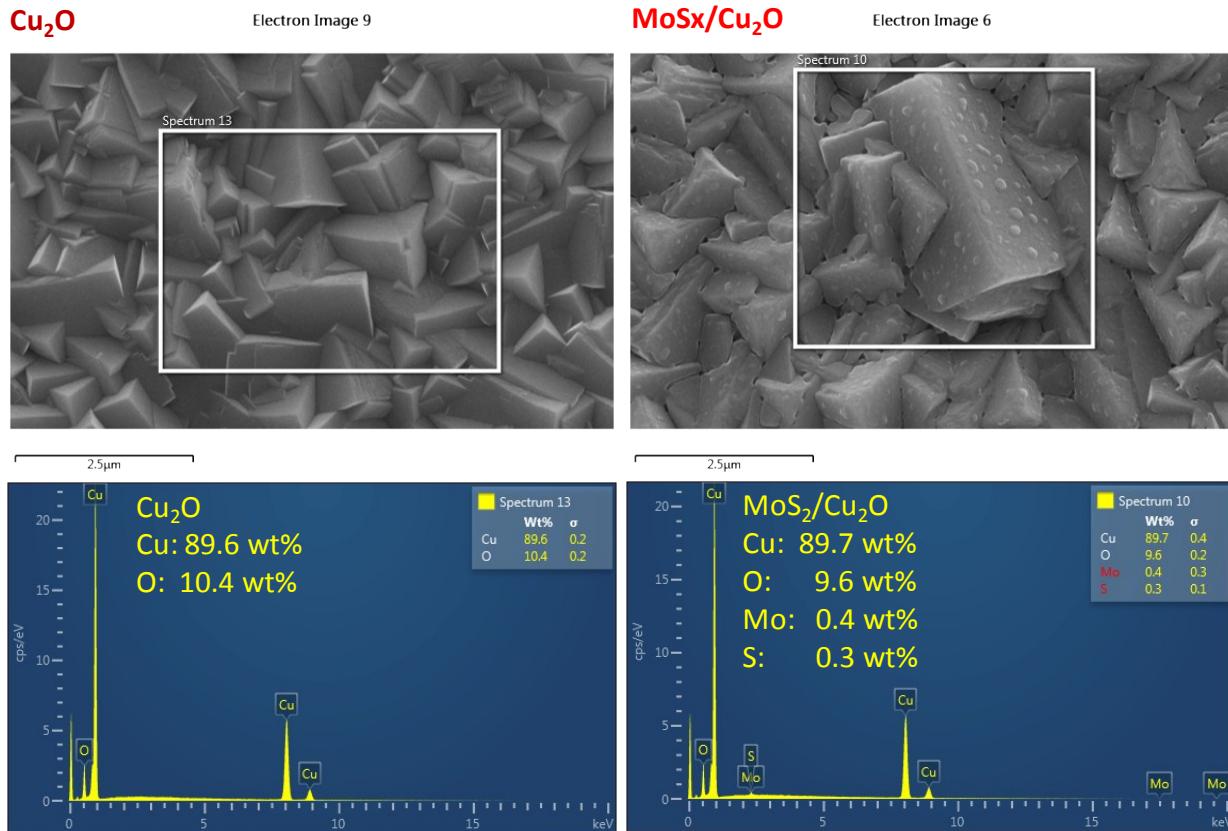

**Figure S5.** Cyclic voltammograms of bare FTO, as-grown MoS<sub>2</sub> (air-dried for 1 min and 15 h), and N<sub>2</sub>-annealed MoS<sub>2</sub> electrodes recorded at the scan rate of 50 mV s<sup>-1</sup> from (A) freshly prepared and (B) N<sub>2</sub>-saturated 0.5 M Na<sub>2</sub>SO<sub>4</sub> electrolytes.

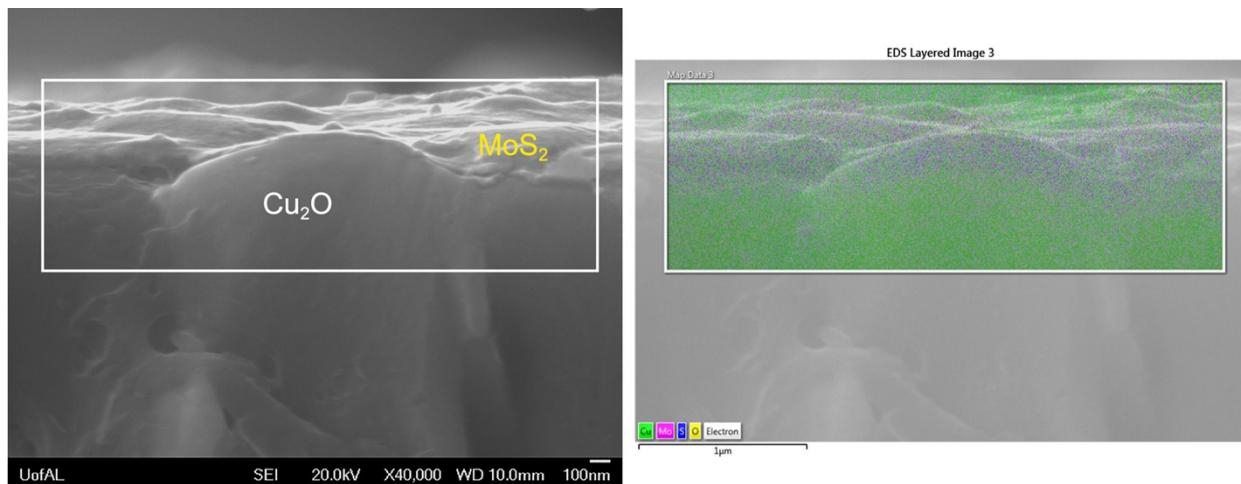

**Figure S6.** Cyclic voltammograms showing catalytic activity for proton reduction by bare FTO (A, B), as-grown 1-min air-dried MoS<sub>2</sub> (C, D), as-grown 15-h air-dried MoS<sub>2</sub> (E, F), and N<sub>2</sub>-annealed MoS<sub>2</sub> (G, H) electrodes from a freshly-prepared and N<sub>2</sub>-saturated 0.5 M Na<sub>2</sub>SO<sub>4</sub> electrolytes recorded at different scan rates (viz. 20, 50, 100, 200, 500, and 1000 mV s<sup>-1</sup>).

**Figure S7.** Cyclic voltammograms showing catalytic ORR activity during proton reduction by Pt electrode from (A) 2 h  $\text{N}_2$ -saturated, (B) freshly-prepared (ambient), and (C) 2 h  $\text{O}_2$ -saturated 0.5 M  $\text{Na}_2\text{SO}_4$  electrolytes recorded at different scan rates (viz. 20, 50, 100, 200, 500, and 1000 mV s<sup>-1</sup>). (D) Overlay of cyclic voltammograms for possible ORR activity at the scan rate of 50 mV s<sup>-1</sup> for Pt electrode in 0.5 M  $\text{Na}_2\text{SO}_4$  electrolyte with or without oxygen. CVs were also recorded with in-situ (live) purging of  $\text{O}_2$  and  $\text{N}_2$  gases at the flow rate of 30 mL cm<sup>-3</sup>.

**Figure S8.** EDS spectra of  $\text{Cu}_2\text{O}$  and  $\text{MoS}_2/\text{Cu}_2\text{O}$  samples for elemental confirmation.

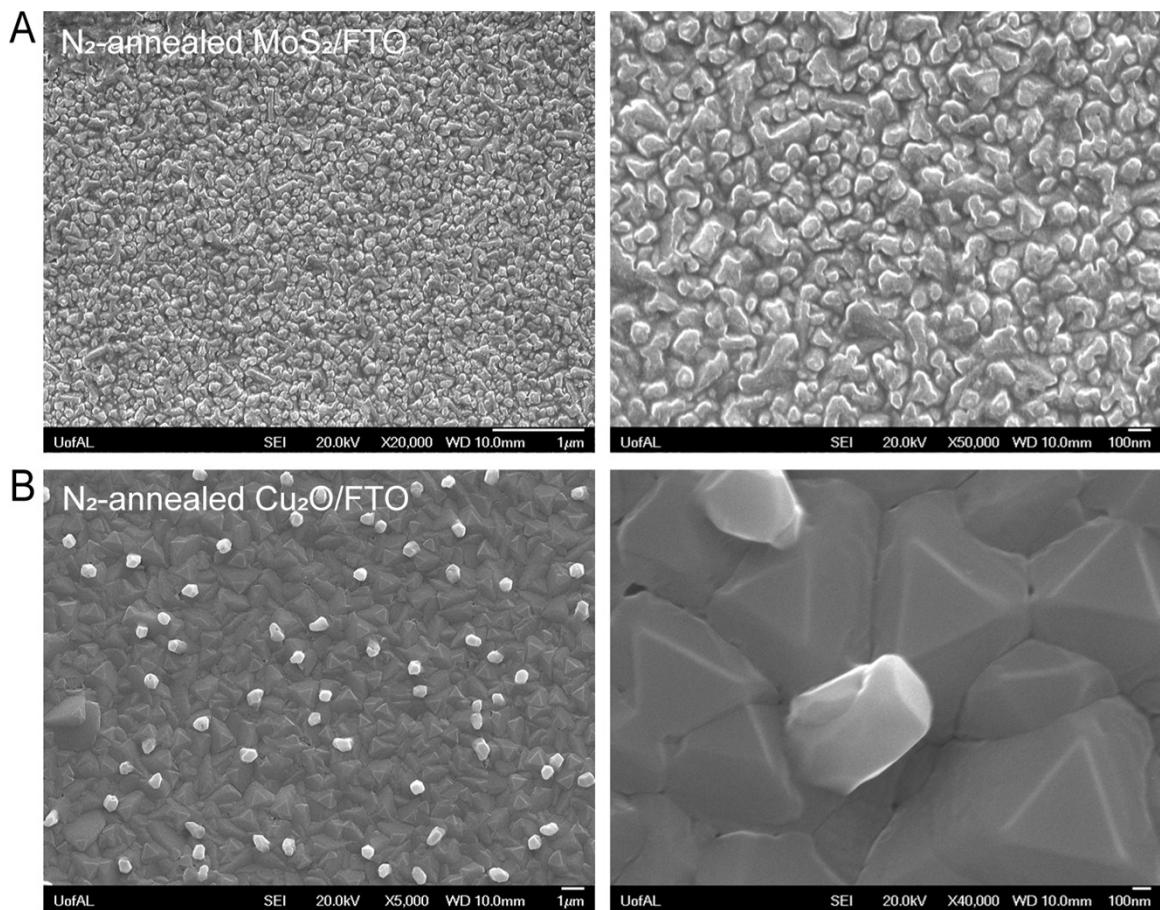

**Figure S9.** Cross-sectional SEM image (40,000X) of  $\text{MoS}_2$ -modified  $\text{Cu}_2\text{O}$  revealing coverage of  $\text{MoS}_2$  on  $\text{Cu}_2\text{O}$ . A drift in the mapped image is observed due to longer exposure time.

The surface coverage of  $\text{MoS}_2$  ( $n_{\text{MoS}_2}$ ) on  $\text{Cu}_2\text{O}$  is estimated using a relation below:<sup>3</sup>

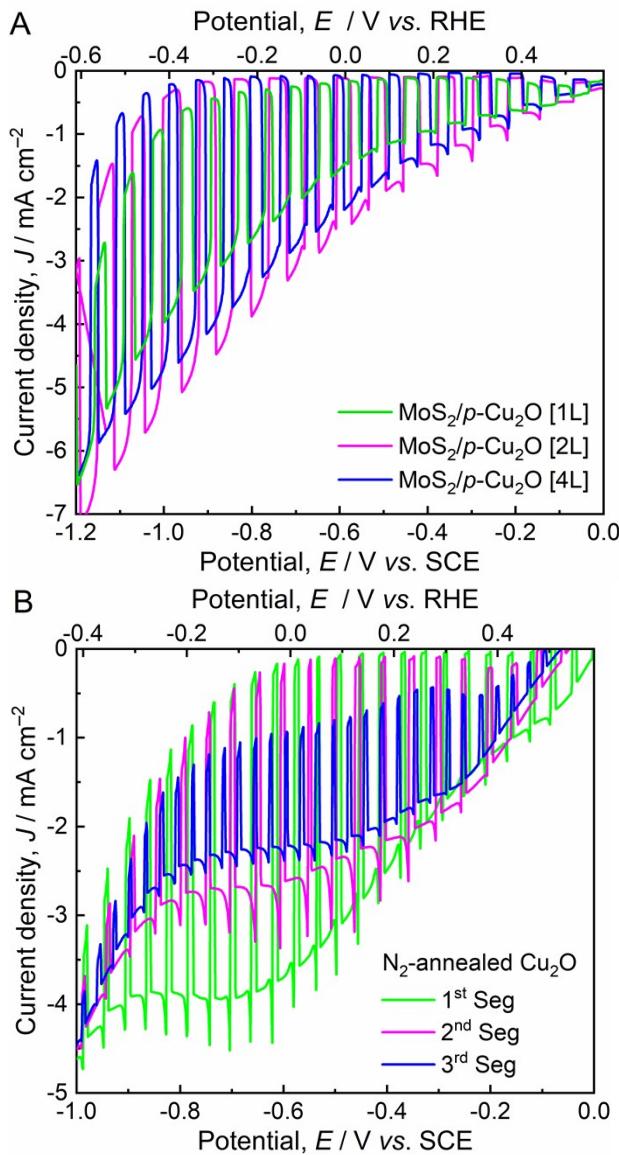

$$n_{\text{MoS}_2} = \rho_{\text{MoS}_2} * N_A * t_{\text{MoS}_2} / MW_{\text{MoS}_2}$$

where,  $\rho_{\text{MoS}_2}$  is the density of  $\text{MoS}_2$ ,  $N_A$  is the Avogadro's number,  $t_{\text{MoS}_2}$  is the film thickness,  $MW_{\text{MoS}_2}$  is the molar mass of  $\text{MoS}_2$ .

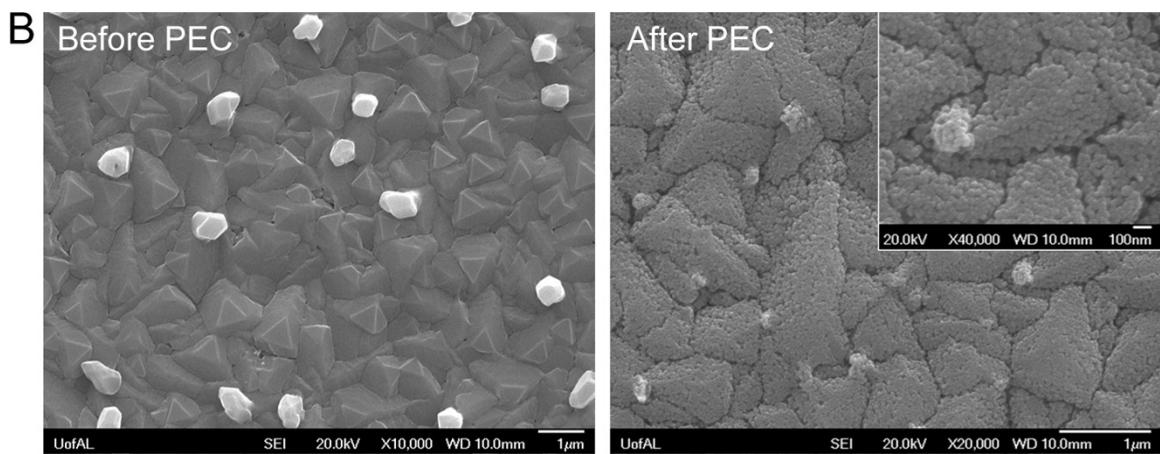

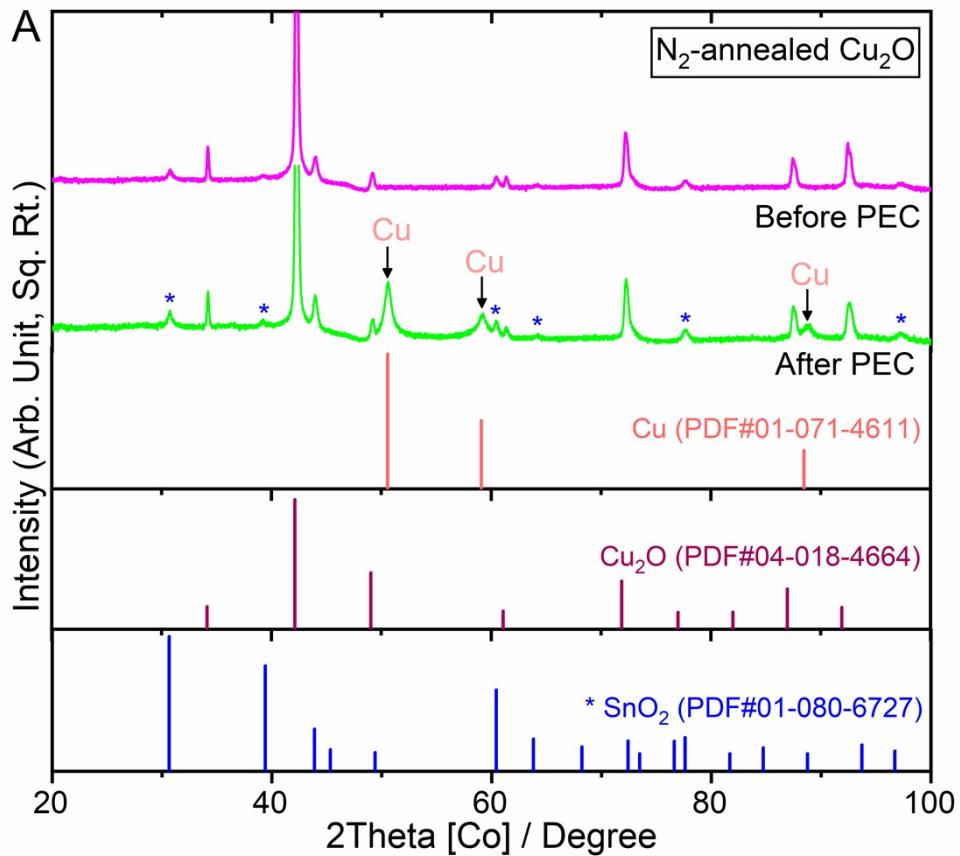

$$\begin{aligned} n_{\text{MoS}_2} &= (5.06 \text{ g cm}^{-3} * 6.023 \times 10^{23} \text{ molecules mol}^{-1} * 0.0000040 \text{ cm}) / \\ &(160.07 \text{ g mol}^{-1}) \\ &= 7.6158 \times 10^{23} \times 10^{-7} \text{ molecules cm}^{-2} \\ &= 7.6158 \pm 0.6 \times 10^{16} \text{ molecules cm}^{-2} \end{aligned}$$

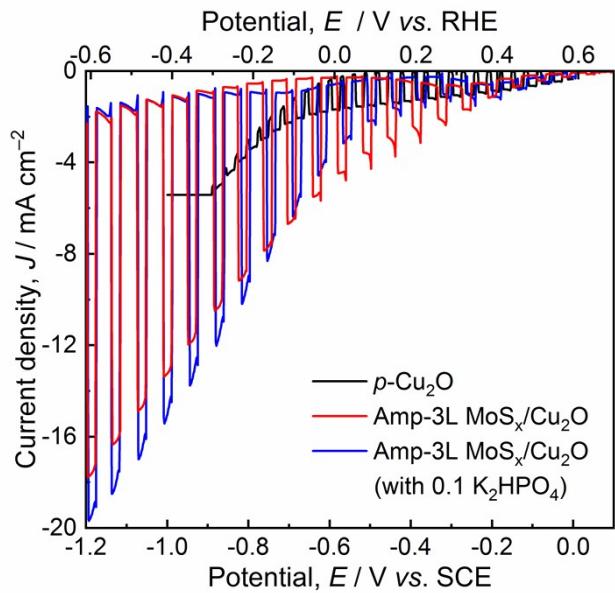

**Figure S10.** SEM images of (A) N<sub>2</sub>-annealed MoS<sub>2</sub> and (B) N<sub>2</sub>-annealed Cu<sub>2</sub>O on FTO substrate at lower and higher magnifications.

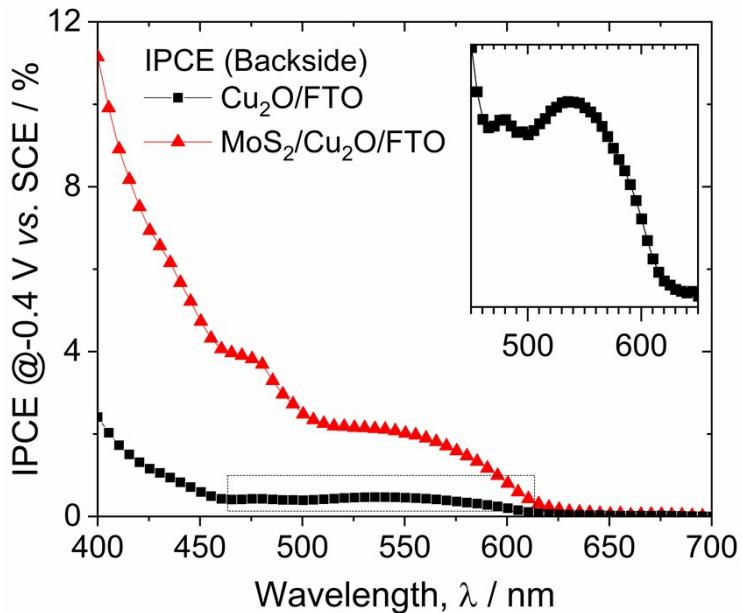

**Figure S11.** Photocurrent responses of (A)  $\text{N}_2$ -annealed  $\text{MoS}_2$ -protected  $\text{Cu}_2\text{O}$  photocathodes (prepared with different spin-coated layers; 1L, 2L, and 4L) and (B)  $\text{N}_2$ -annealed  $\text{Cu}_2\text{O}$  photocathode (3-segment measurement). Electrolyte: 0.5 M  $\text{Na}_2\text{SO}_4$  solution ( $\text{pH} \sim 6.7$ ); Light source: a 300 W Xe lamp; Illumination: simulated 1 sun ( $100 \text{ mW cm}^{-2}$ ).

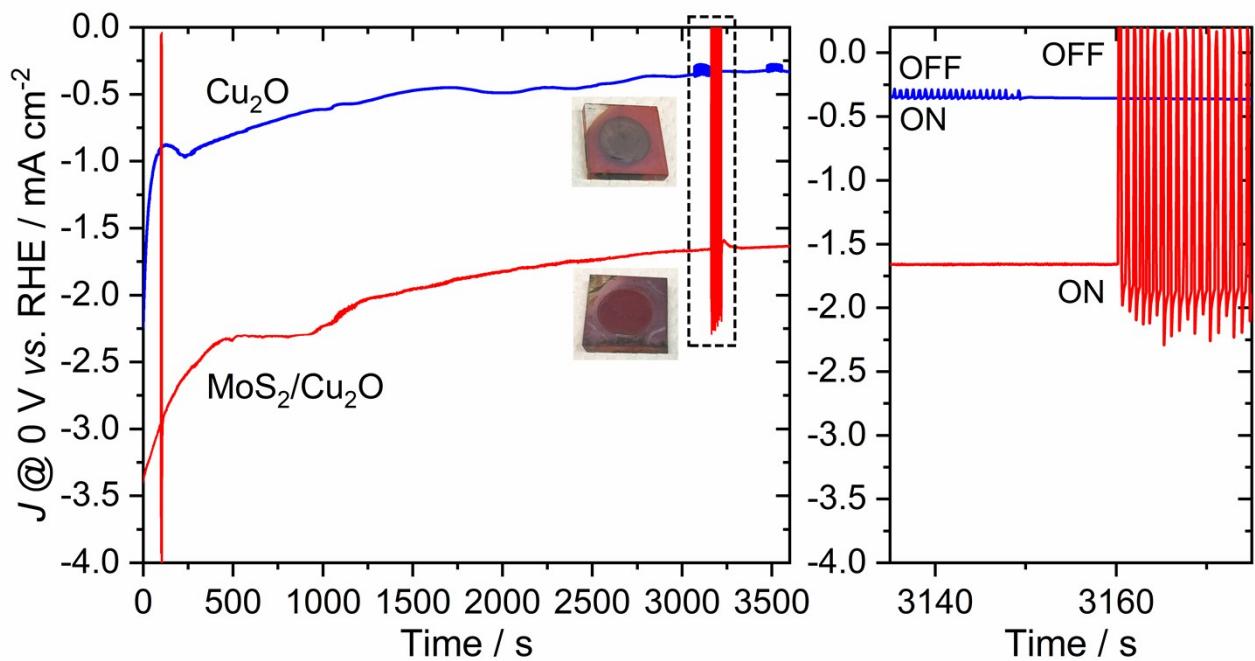

**Figure S12.** (A) Normalized X-ray diffraction patterns and (B) SEM images (showing porous surface morphology) of  $\text{N}_2$ -annealed  $\text{Cu}_2\text{O}$  photoelectrode before and after PEC measurement.

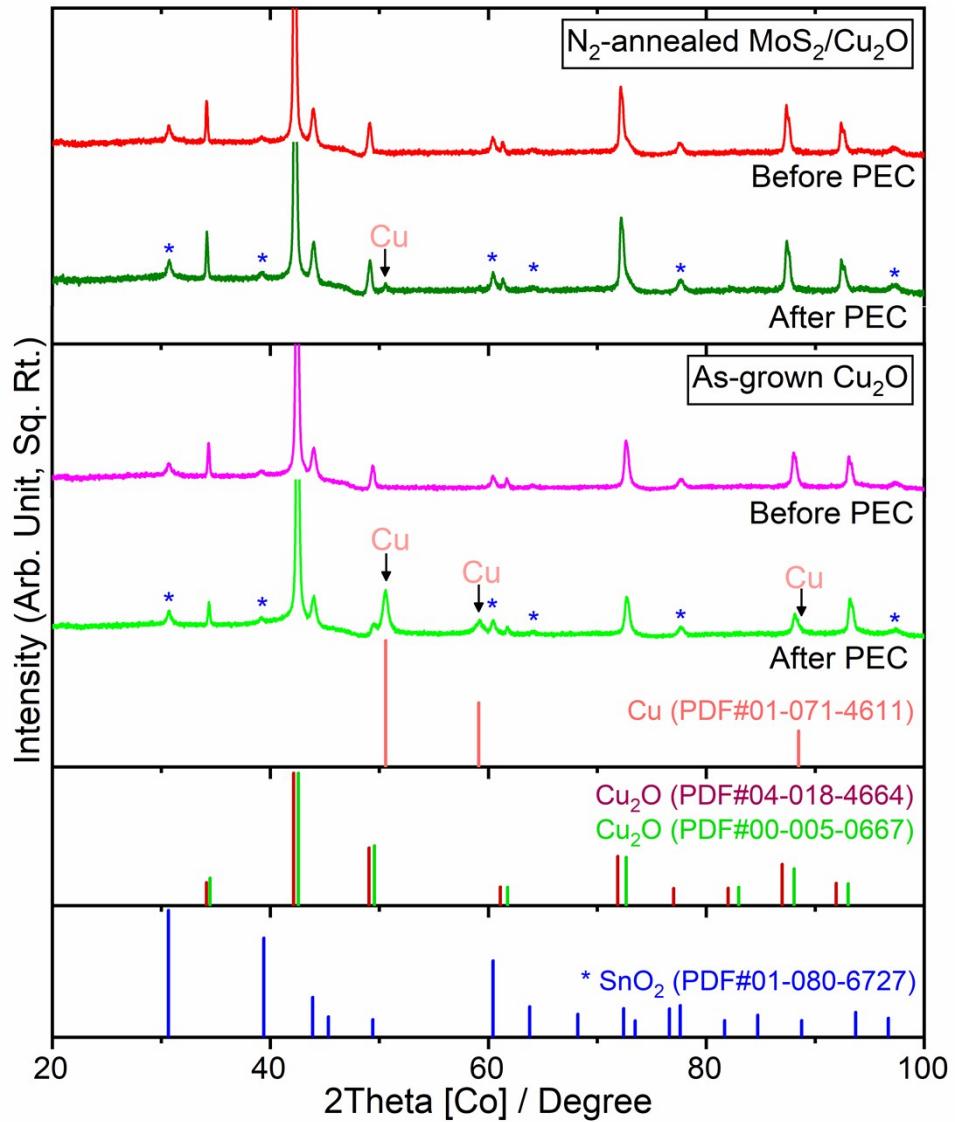

**Figure S13.** Photocurrent responses of as-grown  $\text{MoS}_x$ -protected  $\text{Cu}_2\text{O}$  photocathode (with 3L spin-coated  $\text{MoS}_x$ ). Electrolyte: 0.5 M  $\text{Na}_2\text{SO}_4$  with and without 0.1 M  $\text{K}_2\text{HPO}_4$  solution; Light source: a 300 W Xe lamp; Illumination: simulated 1 sun ( $100 \text{ mW cm}^{-2}$ ).

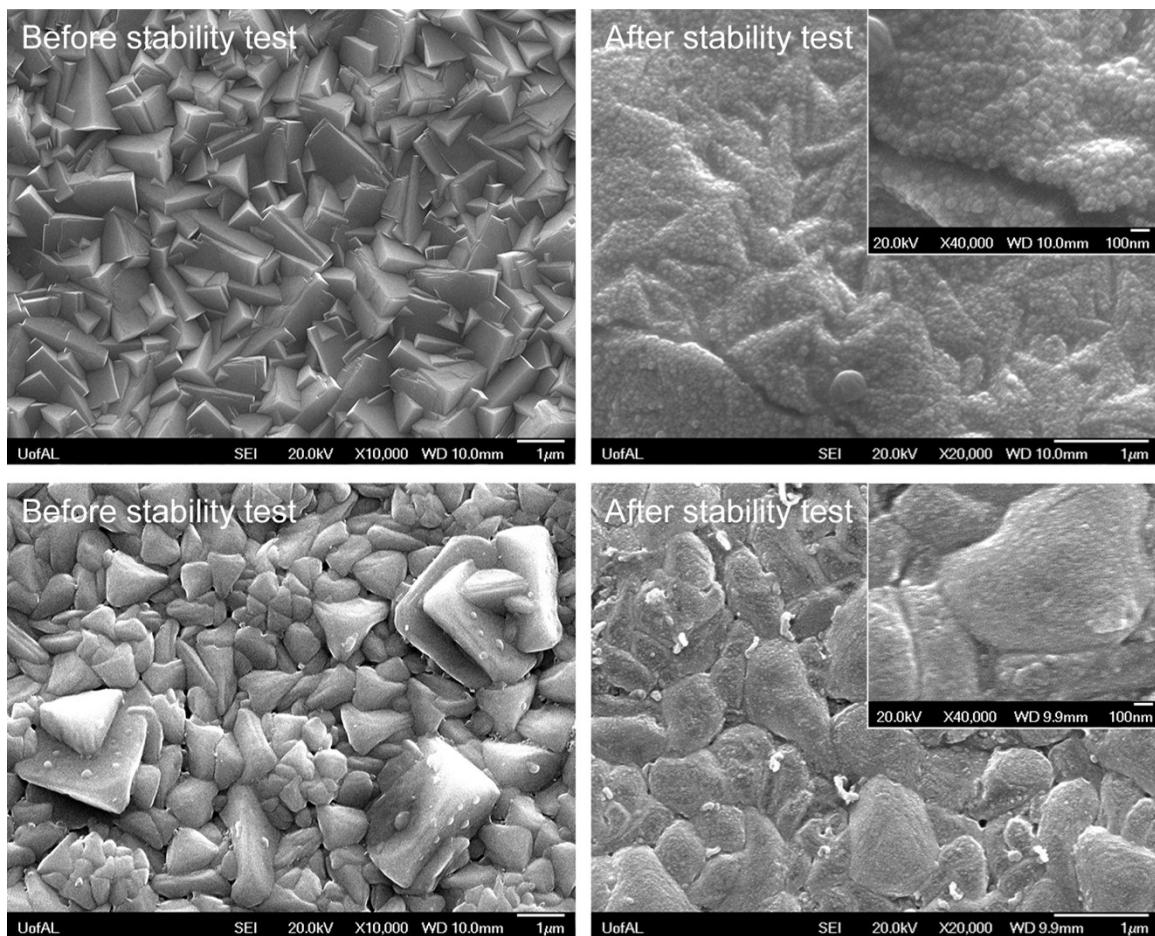

**Figure S14.** IPCE spectra of as-grown  $\text{Cu}_2\text{O}$  and  $\text{MoS}_2/\text{Cu}_2\text{O}$  photocathodes at  $\sim 0.2 \text{ V vs. RHE}$  ( $-0.4 \text{ V vs. SCE}$ ) under backside illumination. Electrolyte: 0.5 M  $\text{Na}_2\text{SO}_4$  solution ( $\text{pH} \sim 6.7$ ).

**Figure S15.** Long-term photostability tests of as-grown  $\text{Cu}_2\text{O}$  and  $\text{MoS}_2$ -modified  $\text{Cu}_2\text{O}$  photocathodes at an applied potential of 0 V vs. RHE in 0.1 M phosphate buffered (pH ~7) 0.5 M  $\text{Na}_2\text{SO}_4$  electrolyte.

**Figure S16.** Normalized X-ray diffraction patterns of as-grown  $\text{Cu}_2\text{O}$  and  $\text{MoS}_2$ -modified  $\text{Cu}_2\text{O}$  photocathodes before and after the 1 h photostability tests.

**Figure S17.** SEM images of (A) as-grown Cu<sub>2</sub>O and (B) MoS<sub>2</sub>-modified Cu<sub>2</sub>O photocathodes before and after the 1 h photostability tests.
