FIG. S1: The anodic voltage difference ΔV between Li and Na halides as a function of the anion radius (pm).

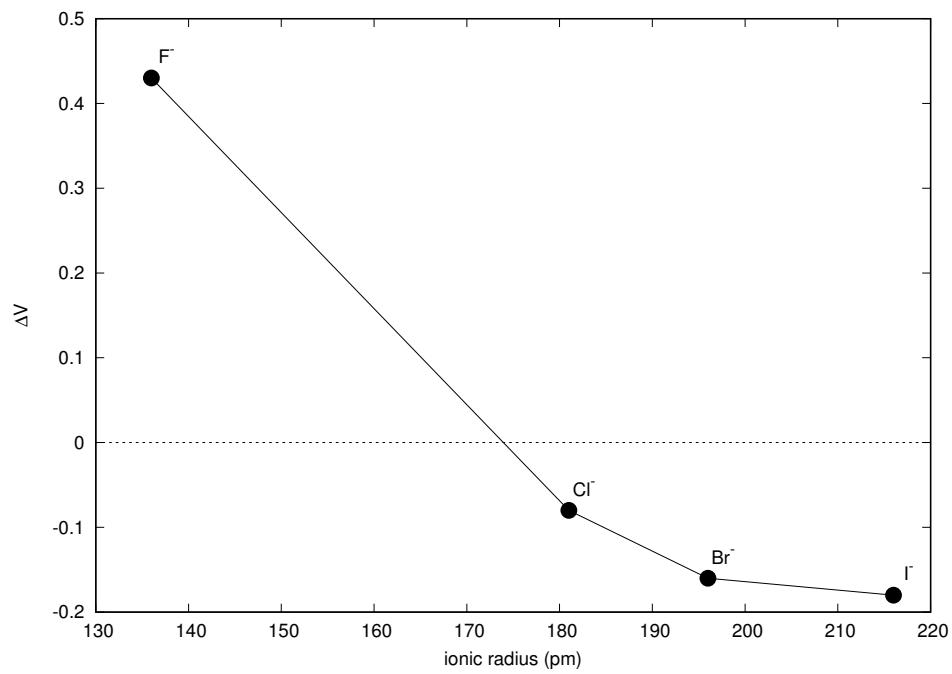

FIG. S2: Driving force for the decomposition of the solid-state NaSICON electrolytes $\text{NaZr}_2(\text{PO}_4)_3$ (red), $\text{NaTi}_2(\text{PO}_4)_3$ (blue), $\text{Na}_4\text{Zr}_2(\text{SiO}_4)_3$ (green) with varying voltage *vs.* Na metal.

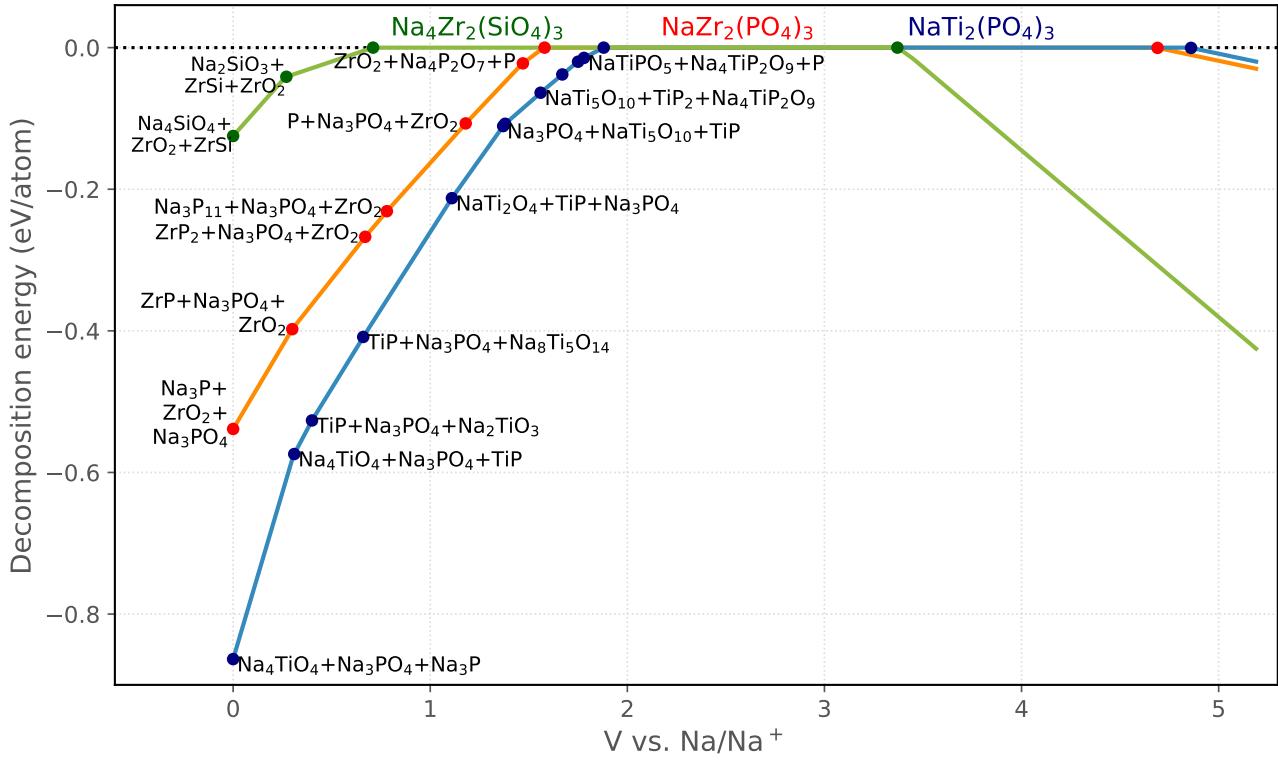

FIG. S3: Electrochemical stability windows calculated for selected Na and Li solid-state electrolyte candidates.

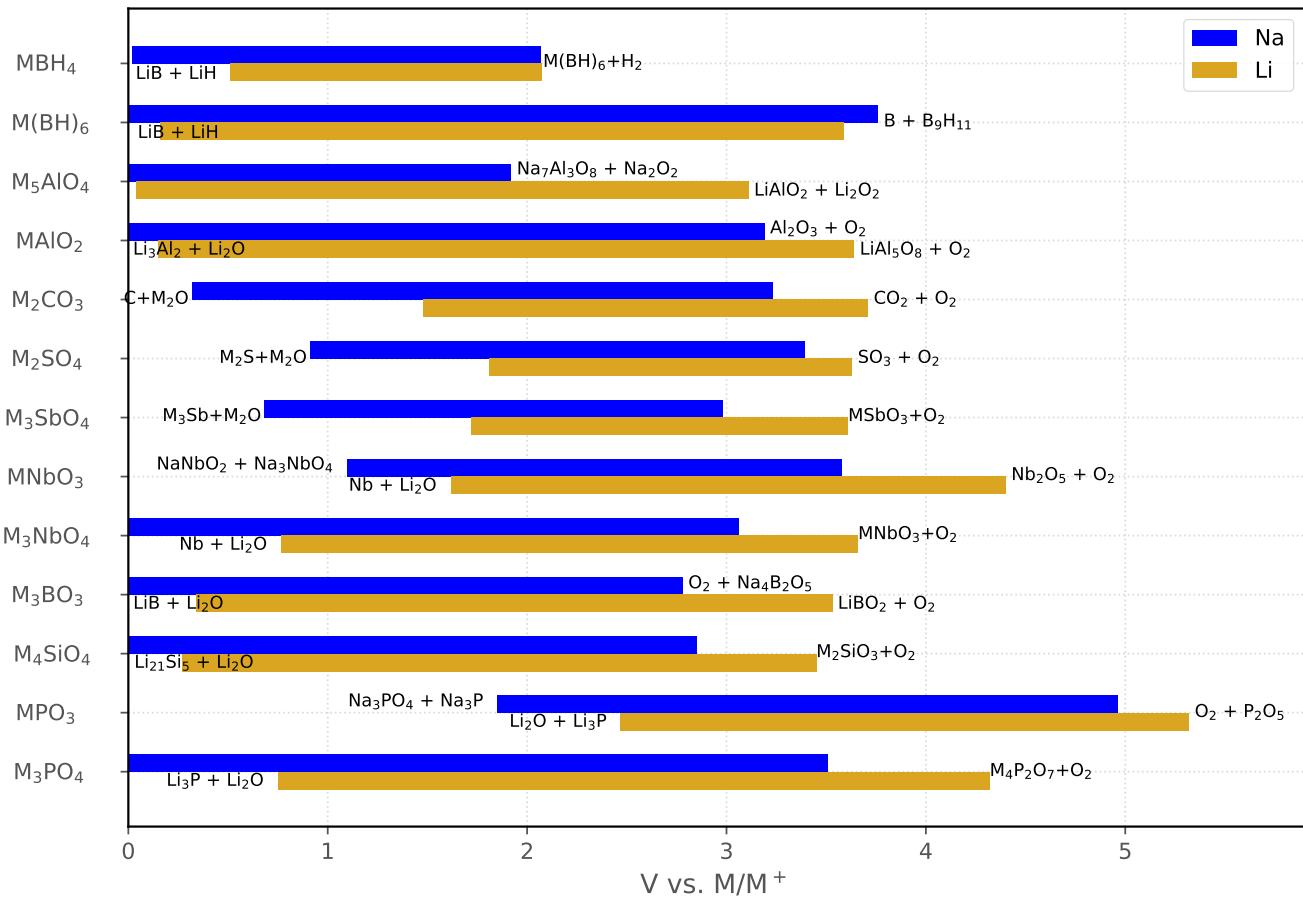

TABLE S1: Predicted reactions for the electrolytes of Figure 2 at their voltage stability limits (V vs. Na/Na^+). Phase equilibria with Na metal and corresponding decomposition energies (ΔE , eV/atom) are also reported. Columns SG and ICSD report the space group numbers of the calculated DFT ground-state structures and collection codes of the originating ICSD records, respectively.

	SG	ICSD	Reduction vs. Na metal		V	Cathodic reaction		Anodic reaction	
			ΔE			Products	V	Products
