## Instrumentation

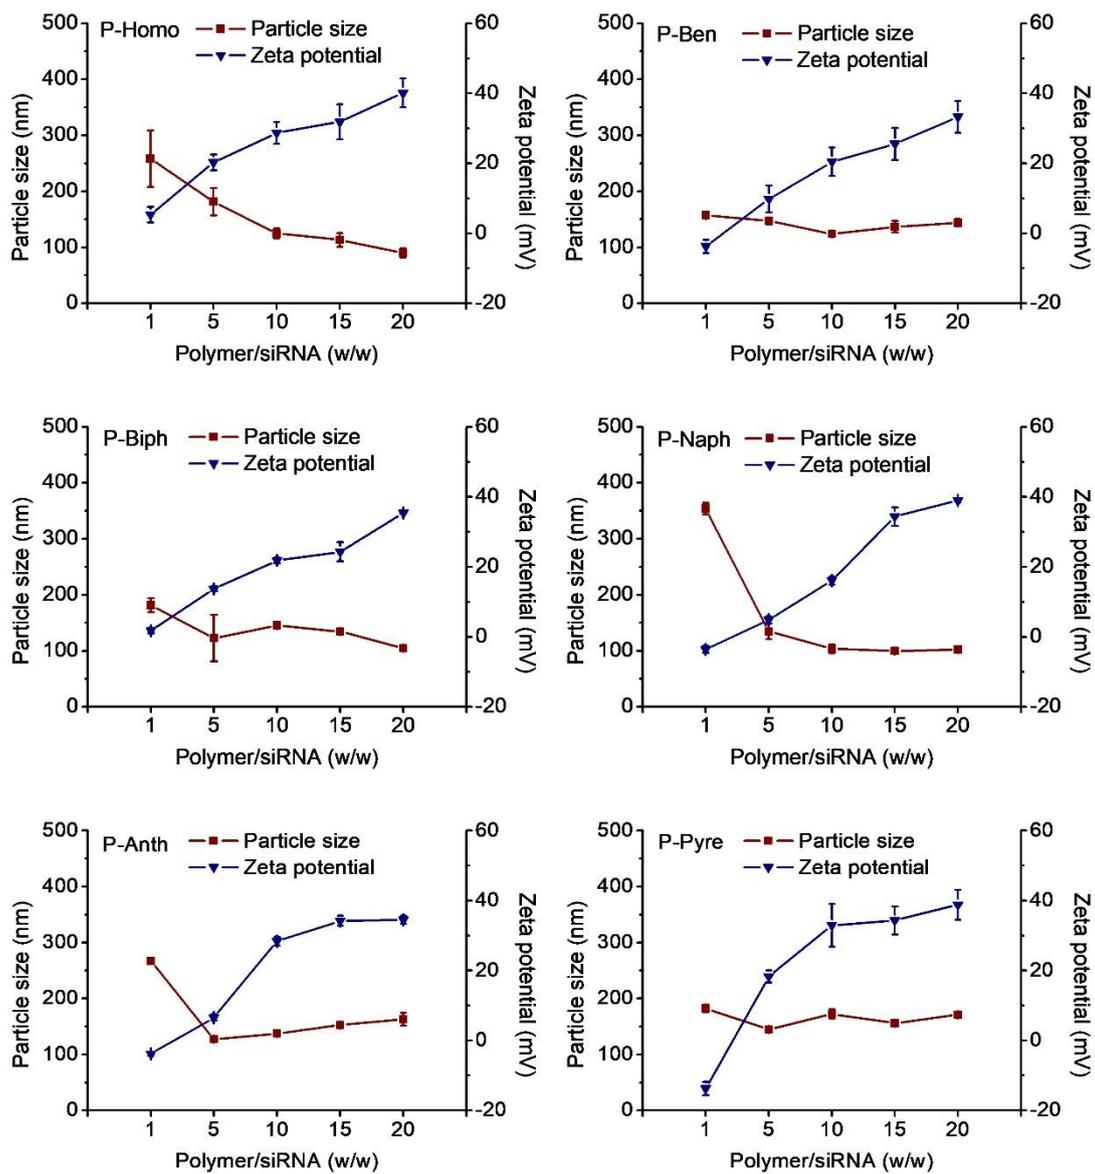

<sup>1</sup>H NMR spectra were recorded on a Varian U400 MHz spectrometer.

Gel permeation chromatography (GPC) experiments were conducted on a system equipped with an isocratic pump (Model 1260, Agilent Technology), a multi-angle laser light scattering (MALLS) detector (Agilent Technology), and a refractive index detector (Agilent Technology). Separations were performed using serially connected size exclusion columns (5 μm, Agilent Technology) using DMF containing 0.05 M LiBr as the mobile phase. The MWs were determined based on the dn/dc value of polymers calculated offline by using the internal calibration system processed by the same software.

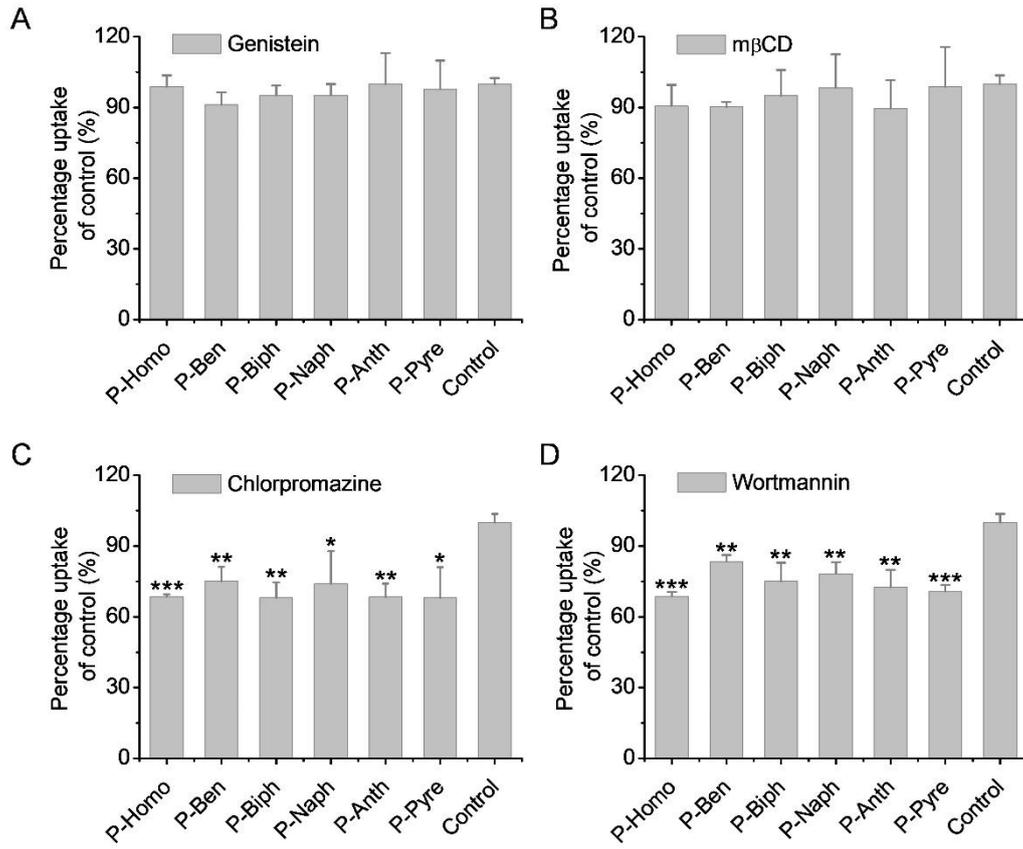

Circular dichroism (CD) experiments were performed on a JASCO J-815 CD spectrometer. Polypeptides were dissolved in deionized (DI) water at the concentrations of 0.05 mg/mL. The solution was placed in a quartz cell with a light path of 1 mm. The mean residue molar ellipticity of each polypeptide was calculated based on the measured apparent ellipticity by the following equation: Ellipticity ( $[\theta]$  in  $\text{deg}\cdot\text{cm}^2\cdot\text{dmol}^{-1}$ ) = (millidegrees  $\times$  mean residue weight)/(pathlength in millimeters concentration of polypeptide in  $\text{mg mL}^{-1}$ ). The helicity of the polypeptides was calculated by the following formula: helicity =  $(-[\theta_{222}] + 3000)/39000$ .<sup>1</sup>
