## Instrument and reagents

All reactants and reagents were commercially available and were used without further purification unless otherwise indicated. Styrene (99\%) and 2-(dimethylamino) ethyl methacrylate (DMAEMA, 98\%) were passed through a basic alumina column before polymerization. 2,2'-azobisisobutyronitrile (AIBN, Sigma, 98\%) was recrystallized twice from methanol. The chain transfer agent (CTA), 4-cyano-4(dodecyl sulfanyl thiocarbonyl) sulfanyl pentanoic acid (CDP), was prepared as previously reported. ${ }^{1}$ Anhydrous $\mathrm{N}, \mathrm{N}$-dimethylformamide (DMF, Sigma Aldrich, 99.9\%) and $\mathrm{CDCl}_{3}$ (Cambridge isotope, $99 \%$ D) were used as received. The sodium salt of the commercially available (Sigma Aldrich) Polystyrene-block-poly(acrylic acid), DDMAT terminated (PS:PAA 3,000:5,000, PDI $\leq 1.1$ ) was used as the negative charged polymer. The NMR spectra were recorded with 500 MHz Bruker and 400 MHz Jeol instruments. Chemical shifts are reported in $\delta$ values relative to the solvent peaks. The solvents used for the spectroscopy experiments were of the spectroscopic grades and were free from any fluorescent impurities. Double. UV spectra were recorded with an Agilant cary 60 UV-vis spectrophotometer. The mass spectrometric data were obtained from an AcquityTM Ultra Performance LC-ESI/quadrupole-TOF MS. X-ray data were collected with Mo K $\alpha$ radiation by a Bruker APEX-2 CCD diffractometer. The data were processed using Bruker SAINT package. The structure solution and refinement were performed by SHELX97. FT-IR spectroscopy in the solid state was performed with a Perkin Elmer Spectrum RX1 spectrophotometer using KBr disk method and the far infrared spectra were recorded by using Bruker ALPHA FTIR spectrometer. It was recorded in absorbance mode from the range $200-500 \mathrm{~cm}^{-1}$ with a resolution of $1 \mathrm{~cm}^{-1}$ and was obtained by averaging over 20 scans. All samples were measured in vacuum and at room temperature. Melting point was measured with a Secor, India digital melting point apparatus in melting point tube. pH data were recorded with a PB-11 Sartorius pH Meter calibrated at $\mathrm{pH} 4,7$ and 10 . DLS data were recorded with HORIBA Scientific Nano Partica NANO PARTICLE ANALYZER SZ-100.

## Experimental Section

## Synthesis of imidazole-appended azobenzene (1)

To a solution of $\mathrm{NaOH}(1.94 \mathrm{~g}, 48.5 \mathrm{mmol})$ in $\mathrm{EtOH} / \mathrm{H}_{2} \mathrm{O}$ mixture, compound $2(0.985 \mathrm{~g}, 4.85 \mathrm{mmol})$ was added. A solution of glucose ( $8.7 \mathrm{~g}, 48.5 \mathrm{mmol}$ ) in hot water was added to the reaction mixture carefully. The mixture was then heated under reflux for 24 h upon which the orange solution turned into red in color. Upon completion of the reaction, the reaction mixture was concentrated under vacuum; the residue was extracted with ethyl acetate, washed with brine, and dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$. After the evaporation of the solvent, the crude material was purified by chromatography (100-200) mesh, silica gel deactivated with $5 \%$ triethyl amine, using $\mathrm{MeOH} / \mathrm{EtOAc}(1: 19)$ as eluent upon which compound 1 was obtained as an orange solid ( 0.356 g , $42 \%$ ). Melting point: $163-165{ }^{\circ} \mathrm{C}$; ${ }^{1} \mathrm{H}$ NMR: (400 $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.94(\mathrm{~d}, \mathrm{~J}=6.3 \mathrm{~Hz}, 2 \mathrm{H}), 7.78(\mathrm{~s}, 2 \mathrm{H}), 7.69(\mathrm{~s}, 2 \mathrm{H}), 7.59(\mathrm{t}, \mathrm{J}=6.3 \mathrm{~Hz}, 2 \mathrm{H}), 7.34(\mathrm{~d}, \mathrm{~J}=5.6$ $\mathrm{Hz}, 2 \mathrm{H}), 7.19(\mathrm{~s}, 2 \mathrm{H}), 7.03(\mathrm{~s}, 2 \mathrm{H}), 5.30(\mathrm{~s}, 4 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR (100 MHz, $\left.\mathrm{CDCl}_{3}\right) \delta 153.6,138.2,130.7,130.6$, $130.5,130.4,123.8,122.2,120.0,51.26$; IR (KBr): 2982, 2917, 1637, 1585, 1414, 1362, 1121, $1034 \mathrm{~cm}^{-}$. ESI-MS m/z (calc.) $[\mathrm{M}+\mathrm{H}]^{+}=343.1671,[\mathrm{M}+\mathrm{Na}]=365.1491,[\mathrm{M}+\mathrm{K}]=381.1230$. (obtained) $[\mathrm{M}+\mathrm{H}]^{+}=$ $343.1678,[\mathrm{M}+\mathrm{Na}]=365.1519,[\mathrm{M}+\mathrm{K}]=381.1302$ are obtained from experimentally.

UV-Vis Data: The trans isomer of compound 1 displayed absorption bands at $\lambda_{\max }=230,319$, and 440 nm . The band at $\lambda_{\max }=319 \mathrm{~nm}\left(\varepsilon=11,800 \mathrm{M}^{-1} \mathrm{~cm}^{-1}\right)$ corresponds to a $\pi-\pi^{*}$ transition, and the band at 440 nm is a symmetry forbidden $\mathrm{n}-\pi^{*}$ band $\left(\varepsilon=110 \mathrm{M}^{-1} \mathrm{~cm}^{-1}\right.$ ). For the cis $1 \lambda_{\max } 319\left(\varepsilon=7040 \mathrm{M}^{-1} . \mathrm{cm}^{-}\right.$ $\left.{ }^{1}\right)$ corresponds to a $\pi-\pi^{*}$ transition and a new peak appeared at $440 \mathrm{~nm}\left(\varepsilon=400 \mathrm{M}^{-1} . \mathrm{cm}^{-1}\right)$.

XRD-Data: single crystal XRD (CCDC 1846676)

## Synthesis of m-nitro benzyl imidazole (2)

To the anhydrous solution of $m$-nitro benzyl bromide ( $0.990 \mathrm{~g}, 4.58 \mathrm{mmol}$ ) in acetonitrile, $\mathrm{K}_{2} \mathrm{CO}_{3}(3.9 \mathrm{~g}$, $27.48 \mathrm{mmol})$ and imidazole ( $1.24 \mathrm{~g}, 18.3 \mathrm{mmol}$ ) were added. The mixture was refluxed for 15 h under argon. Upon completion of the reaction, the reaction mixture was filtered through a sintered funnel and the solvent was removed under vacuum. The residue was dissolved in EtOAc ( 200 mL ) and the organic phase was washed with a saturated $\mathrm{Na}_{2} \mathrm{CO}_{3}$ aqueous solution ( 50 mL ), dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, and evaporated to dryness under vacuum. The crude mixture was purified by column chromatography using 100-200 mesh silica gel and MeOH: EtOAc as eluent to give the $m$-nitro benzyl imidazole as a yellowish solid ( $0.760 \mathrm{~g}, 77 \%$ ); Melting point: $72-75^{\circ} \mathrm{C}$; ${ }^{1} \mathrm{H} \mathrm{NMR}$ : ( $500 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 8.17(\mathrm{~d}, \mathrm{~J}=8.2 \mathrm{~Hz}$, $1 \mathrm{H}), 8.04(\mathrm{~s}, 1 \mathrm{H}), 7.58(\mathrm{~s}, 1 \mathrm{H}), 7.54(\mathrm{dd}, \mathrm{J}=8.2,7.9 \mathrm{~Hz}, 1 \mathrm{H}), 7.42(\mathrm{~d}, \mathrm{~J}=7.6 \mathrm{~Hz}, 1 \mathrm{H}), 7.13(\mathrm{~s}, 1 \mathrm{H}), 6.92(\mathrm{~s}$, 1H), $5.23(\mathrm{~s}, 2 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR (100 MHz, $\left.\mathrm{CDCl}_{3}\right) \delta 143.9,139.1,138.2,133.6,131.2,130.9,124.0,122.8$, 119.9, 50.6; IR (KBr) 2965 (w), 2908 (w), 1615 (m), 1421 (s), 1362 (s), 1025 (s), 907 (m), 739 (m), 617 (w), 558 (w) cm-1; ESI-MS m/z (calc.) 204.07 [M+H]+, (obtained) 204.14;

## Synthesis of m-nitro benzyl bromide (3)

To a solution of $m$-nitro toluene $(2 \mathrm{gm}, 14.59)$ in $\mathrm{CCl}_{4}(45 \mathrm{~mL})$, $\mathrm{NBS}(2.85 \mathrm{gm}, 16.05 \mathrm{mmol})$ and AIBN ( $140 \mathrm{mg}, 1.459 \mathrm{mmol}$ ) were added and the mixture was refluxed for 2 h . The reaction was monitored by TLC. Upon completion, the reaction mixture was filtered and the solvent was evaporated under vacuum. The product was purified by column chromatography by using hexane as eluent and the product was obtained as a white solid ( $1.92 \mathrm{~g}, 60 \%$ ).
${ }^{1} \mathrm{H}$ NMR $\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 8.25(\mathrm{~d}, \mathrm{~J}=2.28 \mathrm{~Hz}, 1 \mathrm{H}), 8.15(\mathrm{dd}, J=8$ and $2.28 \mathrm{~Hz}, 1 \mathrm{H}), 7.72(\mathrm{~d}, J=7.64 \mathrm{~Hz}$, $1 \mathrm{H}), 7.53$ (dd, $J=8.4,7.64,1 \mathrm{H}), 4.53(\mathrm{~s}, 4 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR (100 MHz, $\left.\mathrm{CDCl}_{3}\right) \delta 148.3,139.6,134.9,129.8$, 123.8, 123.2, 31.0

RAFT Copolymerization of DMAEMA and Styrene. In a typical RAFT copolymerization procedure, DMAEMA ( $440.2 \mathrm{mg}, 2.8 \mathrm{mmol}$ ), styrene ( $437.44 \mathrm{mg}, 4.2 \mathrm{mmol}$ ), CDP ( $70.6 \mathrm{mg}, 0.175$ $\mathrm{mmol})$, AIBN ( $5.75 \mathrm{mg}, 0.035 \mathrm{mmol}$ ) and DMF ( 2.4 g ) were sealed in a 20 mL glass vial equipped with a magnetic stir bar and purged with dry $\mathrm{N}_{2}$ for 20 min and the reaction vial was kept in a preheated reactor at $70{ }^{\circ} \mathrm{C}$. The $[\mathrm{DMAEMA}+$ Styrene]:[CDP]:[AIBN]ratio was kept at 40:1:0.2, while the concentration ratio of DMAEMA and styrene in the feed was fixed at $40: 60$, respectively. The polymerization was allowed to continue for 6 h and the resulting solution was quenched by cooling in ice cold water and exposed to air. Approximately 3 mL acetone was added to this solution, and the polymer was precipitated into cold hexanes. The copolymer was re-precipitated four times from acetone/hexanes and dried under high vacuum at room temperature for 18 h . The purified polymer ( $200 \mathrm{mg}, 0.03 \mathrm{mmol}$ ) was treated with methyl iodide ( $2 \mathrm{~mL}, 0.5 \mathrm{mmol}, 20 \mathrm{eq}$ ) in acetonitrile under 40 ${ }^{\circ} \mathrm{C}$ heat for 12 h . Evaporated the acetonitrile solvent under reduced pressure and purified by ethyl acetate. Scheme S3: Synthesis of the cationic polymer A

## Photoisomerization studies:

Photoisomerization experiments were performed with compound $1(30 \mu \mathrm{M})$ in MeOH . The $E$ to $Z$ photoisomerization of azobenzene was observed by irradiating the sample with 366 nm UV light (8 W, irradiation power $2.3 \mathrm{~mW} \mathrm{~cm}^{-2}$ ) under ice-cold conditions (273K). The reverse isomerization ( $Z$ to $E$ ) was achieved by exposing the sample with blue LED light ( 8 W ) at $0{ }^{\circ} \mathrm{C}$. The isomerization was monitored by studying the change in the UV/Vis absorption spectra and also by ${ }^{1} \mathrm{H} N M R$ analysis.
A.

Fig. S1. Changes in electronic absorption spectrum for the $\mathbf{( A )} E$ to $Z$ and $\mathbf{( B )} Z$ to $E$ isomerization of the azobenzene 1 upon exposure to 366 nm UV light and 466 nm blue light respectively in MeOH $(30 \mu \mathrm{M})$ at 273 K .

Fig. S2. NMR traces of compound 1 in $\mathrm{CD}_{3} \mathrm{OD}\left(10^{-2} \mathrm{M}\right.$ ) displaying the clear shift in the aromatic and aliphatic protons upon photo isomerization. (A) After radiation of the trans form with 366 nm light for 240 min ; (B) trans form (bottom trace). New peaks are indicating by arrow sign.

## General procedure for the hydrolysis

Each assay was performed on 3 mL of samples prepared in 1 mM PBS buffered at pH 7.6 solution with the azobenzene derivative ( $9 \mu \mathrm{M}$ ) or nothing (as control). The reactions were performed in the darkness at $25^{\circ} \mathrm{C}$. The photoiraadiated (Z)-form of the catalyst was exposed to the 366 nm light periodically for ensuring its retention in the (Z)-form. The formation of the 4-nitrophenol (4-NP) was monitored by the appearance of the peak at 400 nm with UV/vis spectroscopy at room temperature. The concentration of the 4-NP species was calculated at individual pH from the molar absorptivity of the species at each of the pH at 400 nm .

Fig. S3. Changes in electronic absorption spectrum for (A). $E$ to $Z$ and (B). $Z$ to $E$ isomerization of azobenzene $1(30 \mu \mathrm{M})$ with $\mathrm{Zn}(\mathrm{OAc})_{2}(30 \mu \mathrm{M})$ upon exposure to 366 nm UV light and 466 nm blue light respectively in MeOH solution.

With increasing the $\mathrm{Zn}(\mathrm{OAc})_{2}$ in the azobenzene solution, it is observed that there was a 10 nm blue shift of the $\pi-\pi^{*}$ band from 319 nm to 309 nm . The $\left[\mathrm{Zn}^{2+} .1\right]$ was also studied by NMR spectroscopy.

Fig. S4. Systematic NMR titration of trans 1 with gradual increase of $\mathrm{Zn}(\mathrm{OAc})_{2}$ in MeOD: $\mathrm{D}_{2} \mathrm{O}(6: 1)$ mixture, red arrow for the c* proton, blue arrow for the a* proton and black arrows for the $h^{*}$ proton
