## 2 General Methods

All reactions were performed using standard Schlenk techniques or in a nitrogen-filled glovebox (GS Glovebox Systemtechnik). Glassware was dried in a hot oven at $120{ }^{\circ} \mathrm{C}$ overnight before use. NMR spectra were recorded at ambient temperature using $\mathrm{CDCl}_{3}$ or $\mathrm{C}_{6} \mathrm{D}_{6}$ as solvent, with proton, carbon, and fluorine resonances at 400/300/250, 101/75/63 and 235 MHz , respectively. All NMR data are reported in parts per million (ppm,) and coupling constants in Hertz ( Hz ). The ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra were referenced to the solvent peak: $\mathrm{CDCl}_{3}$ ( 7.27 ppm in ${ }^{1} \mathrm{H}$ and 77.0 ppm in ${ }^{13} \mathrm{C}$ ), $\mathrm{C}_{6} \mathrm{D}_{6}\left(87.16 \mathrm{ppm}\right.$ in ${ }^{1} \mathrm{H}$ and 128.39 ppm in $\left.{ }^{13} \mathrm{C}\right)$. ${ }^{19} \mathrm{~F}$ NMR spectra were externally referenced to $\mathrm{CFCl}_{3}(0.00 \mathrm{ppm})$. Coupling constants are reported in hertz $(\mathrm{Hz})$. Elemental analyses were performed on an Elementar vario MICRO-cube elemental analyzer. Mass spectrometric data were acquired on a GC-MS Agilent 5977B MSD. The MS ionization was achieved by $\mathrm{EI}^{+}$. Melting points were measured on a Mettler FP 61. Infrared spectra were recorded on BrukerVertex 70 Spectrometer with Universal ATR Sampling Accessory. Bands are given in $\mathrm{cm}^{-1}$ with intensities (vs very strong, s strong, m medium, w weak). Melting points were measured on a Mettler Toledo MP70. GC analyses were carried out using an HP-5 capillary column (Phenyl methyl siloxane, $30 \mathrm{~m} \times 320 \times 0.25$, $100 / 2 \cdot 3-30-300 / 3,2 \mathrm{~min}$ at $60^{\circ} \mathrm{C}$, heating rate $30^{\circ} \mathrm{C} / \mathrm{min}, 3$ or 10 min at $300^{\circ} \mathrm{C}$ ). Column chromatography was performed on a CombiFlash Companion (Isco) or on a Reveleris X2 (BUCHI) Flash Chromatography-System using Reveleris packed columns (12 g). Solvents were dried over molecular sieves or obtained from the solvent-drying system (Braun SPS System) and stored over 3 or $4 \AA$ molecular sieves. Molecular sieves were activated in the microwave prior to use. All solvents were degassed by bubbling argon trough the solvent. $\left\{(\mathrm{IPr}) \mathrm{PdCl}_{2}\right\}_{2}(\mathrm{UMICORE} \mathrm{CX} 41),[\mathrm{Pd}(\mathrm{allyl}) \mathrm{Cl}]_{2}$ and $\mathrm{PdBr}_{2}$ were donated by UMICORE. All other compounds were bought from commercial sources and used without further purification.

## 3 Screening Tables of the reaction conditions

### 3.1 Suzuki-Miyaura Coupling

General Procedure for the reaction screening condition of Suzuki-Miyaura Coupling of p-chlorotoluene with phenylboronic acid

An oven dried crimp cap vial equipped with a Teflon coated magnetic stirring bar was charged with base and phenylboronic acid. The vial was sealed, and evacuated and backfilled with argon three times. $p$-Chlorotoluene ( $65 \mathrm{mg}, 0.5 \mathrm{mmol}, 1$ equiv.) was added via syringe. Degassed solvent ( 1 mL ) and $n$-tetradecane were added to the reaction as GC internal standard. Then, a freshly prepared stock solution of Pd-1 ( 0.025 M in toluene, $0.1 \mathrm{~mL}, 0.0025 \mathrm{mmol}, 0.005$ equiv.) was added via syringe and the reaction was stirred at the temperature and time reported in the table S1. Then, the reaction was analysed by GC.

## 4 Synthetic Procedures

### 4.1 Synthesis of $[(\operatorname{IPr}) P d I]_{2}(\mathbf{P d}-1)$

$\left[(\operatorname{IPr}) \mathrm{PdI}_{2}\right]_{2}(1.37 \mathrm{~g}, 0.91 \mathrm{mmol}, 1 \mathrm{eq}$.$) were weighted into a Schlenk flask and the air was$ replaced by argon. This solution was added to the stirred solution of the Pd-complex and the mixture stirred for 6 h at ambient temperature. The volatiles were removed under vacuo and the remaining greenish solid was extracted with toluene ( 3 x 9 mL ). The combined organic solutions were dried under vacuo to obtain $[(\mathrm{IPr}) \mathrm{PdI}]_{2}(678 \mathrm{mg}, 60 \%)$ as a dark green solid. Single crystals of $\mathbf{P d} \mathbf{- 1}$ suitable for X-ray diffraction were obtained by evaporation of toluene.

Pd-3

## Method A:

A 100 mL crimp cap vial was charged with $\left[(\mathrm{IPr}) \mathrm{PdCl}_{2}\right]_{2}(1.13 \mathrm{~g}, 1 \mathrm{mmol}, 1 \mathrm{eq}$. $)$ and potassium bromide ( $4.76 \mathrm{~g}, 40 \mathrm{mmol}, 40 \mathrm{eq}$.) and suspended in 50 mL acetone. The mixture was heated to $50^{\circ} \mathrm{C}$ and stirred for 7 days. Then, the solution was filtrated, and volatiles were removed under reduced pressure. The remaining brown solid was dissolved in 50 mL of dichloromethane and washed three times with 10 mL of water. The aqueous layer was extracted three times with 20 mL of dichloromethane and the combined organic layers were dried over magnesium sulfate. The removal of volatiles under vacuum yielded $\left[(\operatorname{Pr}) \mathrm{PdBr}_{2}\right]_{2}(1.30 \mathrm{~g}, 99 \%)$ as an orange solid.

## Method B:

Under an argon atmosphere, an oven dry Schlenk tube was charged with palladium(II) bromide ( $226 \mathrm{mg}, 1 \mathrm{mmol}, 1$ equiv.). To the solid, 6 mL of acetone was added and the suspension was heated to $40^{\circ} \mathrm{C}$ for 15 h . After evaporating the solvent, the residual solid was heated to $120^{\circ} \mathrm{C}$ for 2 h under high vacuum. Then, the solid was cooled to room temperature and 4 ml of dry THF was added. After, a solution of $\operatorname{IPr}(289 \mathrm{mg}, 1 \mathrm{mmol}, 1$ equiv.) in 6 mL of dry THF was added. The dark red reaction mixture was stirred for 3 h at ambient temperature. After, the solution was filtered through celite and washed with several portions of THF until the filtrate was colourless. After the removal of volatiles a dark red solid afforded which was purified by flash chromatography (cyclohexane/ethyl acetate 9:1) yielding Pd-3 ( $455 \mathrm{mg}, 69 \%$ ) as the orange solid and trans- $(\operatorname{IPr})_{2} \mathrm{PdBr}_{2}$ as byproduct ( $123 \mathrm{mg}, 6 \%$ ) as orange solid. Single crystals of trans-(IPr) $)_{2} \mathrm{PdBr}_{2}$ suitable for X-ray diffraction were obtained by slow evaporation of ethyl acetate.

### 4.4 Synthesis of $(\mathrm{IPr})_{2} \mathrm{PdHBr}(\mathbf{P d}-4)$

Pd-4
Under an argon atmosphere, an oven dry Schlenk tube was charged with [(IPr) $\left.\mathrm{PdBr}_{2}\right]_{2}(262 \mathrm{mg}$, $0.2 \mathrm{mmol}, 1$ equiv.). The solid was dissolved in 4 ml of dry and degassed toluene and a solution of KOH ( $22.4 \mathrm{mg}, 0.4 \mathrm{mmol}$, 2 equiv.) in 2 mL of dry and degassed MeOH was added. The mixture was stirred for 16 hours and the solvent was removed. The crude solid was extracted two times with 4 mL of toluene and the volatiles were removed under vacuum. Analysis by ${ }^{1} \mathrm{H}$ NMR of the solid in $\mathrm{C}_{6} \mathrm{D}_{6}$ showed to be mainly starting material and Pd-4. The solid was redissolved in toluene and layered with acetone to obtain brownish crystals of Pd-4.

## General procedure for the Buchwald-Hartwig amination of aryl chlorides

An oven dried crimp cap vial equipped with a Teflon coated magnetic stirring bar was charged sodium tert-butoxide ( $147 \mathrm{mg}, 1.5 \mathrm{mmol}, 1.5$ equiv.). The vial was sealed, and evacuated and backfilled with argon three times. Then, a freshly prepared stock solution of Pd-1 ( 0.005 M in THF, $1 \mathrm{~mL}, 0.005 \mathrm{mmol}, 0.005$ equiv.) was added via syringe followed by aryl chloride ( $1 \mathrm{mmol}, 1$ equiv.) and morpholine ( $93 \mu \mathrm{~L} 1.05 \mathrm{mmol}, 1.05$ equiv.). The reaction mixture was stirred for 2 h at $40^{\circ} \mathrm{C}$. The reaction solution was diluted with 10 mL ethyl acetate and washed with 10 mL water. Then the aqueous layer was extracted with ethyl acetate $2 \times 10 \mathrm{~mL}$. The combined organic layers were washed with 10 mL of brine and dried over $\mathrm{MgSO}_{4}$. ## General procedure for the Sonogashira coupling of aryl iodides

In a nitrogen filled glovebox, an oven dried crimp cap vial equipped with a Teflon coated magnetic stirring bar was charged with $\mathbf{P d} \mathbf{- 1}(6.2 \mathrm{mg}, 0.005 \mathrm{mmol}, 0.005$ equiv.). The vial was removed from the glovebox and the complex was dissolved in dry and degassed $\mathrm{MeCN}(2 \mathrm{~mL})$. After, the aryl iodide ( $1 \mathrm{mmol}, 1$ equiv.) was added via syringe followed by triethylamine ( $279 \mu \mathrm{~L}, 2 \mathrm{mmol}$, 2 equiv.) and $134 \mu \mathrm{~L}$ phenylacetylene ( $1.2 \mathrm{mmol}, 1.2$ equiv.). The reaction mixture was stirred for 16 h at $40^{\circ} \mathrm{C}$. After, the reaction solution was diluted with 10 mL ethyl acetate and washed with 10 mL water. Then the aqueous layer was extracted with ethyl acetate $2 \times 10 \mathrm{~mL}$. The combined organic layers were washed with 10 mL of brine and dried over $\mathrm{MgSO}_{4}$. Afterwards the crude reaction mixture was purified by flash chromatography.
