1. General information

All glassware was thoroughly oven-dried. Chemicals and solvents were either purchased from commercial suppliers or purified by standard techniques. Thin-layer chromatography (TLC) plates were visualized by exposure to ultraviolet light and/or staining with phosphomolybdic acid followed by heating on a hot plate. Flash chromatography was carried out using silica gel (200-300 mesh). ¹H NMR and ¹³C NMR spectra were recorded on a Bruker AM-400 (400 MHz). The spectra were recorded in deuteriochloroform (CDCl₃) as solvent at room temperature, ¹H and ¹³C NMR chemical shifts are reported in ppm relative to the residual solvent peak. The residual solvent signals were used as references and the chemical shifts were converted to the TMS scale (CDCl₃: δ_H = 0 ppm, δ_C = 77.00 ppm). Data for ¹H NMR are reported as follows: chemical shift (δ ppm), multiplicity (s = singlet, d = doublet, t = triplet, q = quartet, m = multiplet, dd = doublet), integration, coupling constant (Hz) and assignment. Data for ¹³C NMR are reported as chemical shift. HRMS were performed on a Bruker Apex II mass instrument (ESI).

Table S1. Screening of Photocatalysts, Bases, and Solvents^a

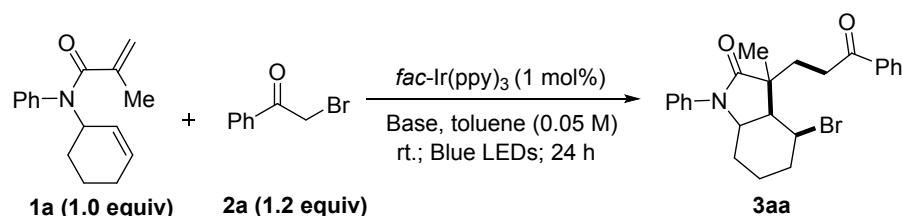

The reaction scheme illustrates the photocatalytic cyclization of compound **1a** (0.1 mmol) and bromoacetylbenzene **2a** (1 equiv) in the presence of a photocatalyst (X mol %), base, and solvent at room temperature under blue LED irradiation for 24 h. The product **3aa** is shown as a bicyclic compound where the benzylidene group from **1a** has reacted with the acetyl group from **2a**.

3.2 General procedure for the synthesis of substrates

Preparation of **S1**

According to a modified literature procedure,¹ under an air atmosphere, cyclohexene (10.1 mL, 100 mmol, 1.0 equiv) was added to a 150 mL round bottom flask containing a suspension of AIBN (12.5 mg, cat.) and NBS (11.572 g, 65 mmol, 0.65 equiv) in cyclohexane (50 mL); the round bottom was fitted with a condenser, and refluxed at 80 °C for 3 hours. The reaction was cooled to room temperature, filtered through a glass frit, and carefully concentrated *in vacuo* to yield a crude oil. Vacuum distillation yielded **S1** (8.35 g, 80% with respect to NBS) as a colorless oil. The material was used within one day of preparation, or stored at –20 °C indefinitely.

Preparation of **S2-a**

According to a modified literature procedure,² a solution of aniline (3.2 mL, 35 mmol, 2.7 equiv) in MeCN (40 mL) was treated with 3-bromocyclohexene **S1** (1.50 mL, 13.0 mmol, 1.0 equiv) and K₂CO₃ (1.97 g, 14.3 mmol, 1.1 equiv). After 2 h at rt, the reaction mixture was quenched with H₂O (20 mL) and extracted with EtOAc (2 x 30 mL). The combined organic extracts were washed with brine (30 mL), dried over Na₂SO₄, filtered, evaporated under reduced pressure and purified by column chromatography (PE/EA = 50:1–30:1) to give amine **S2-a** (2.137 g, 95 %) as a colourless oil.

Preparation of **1**

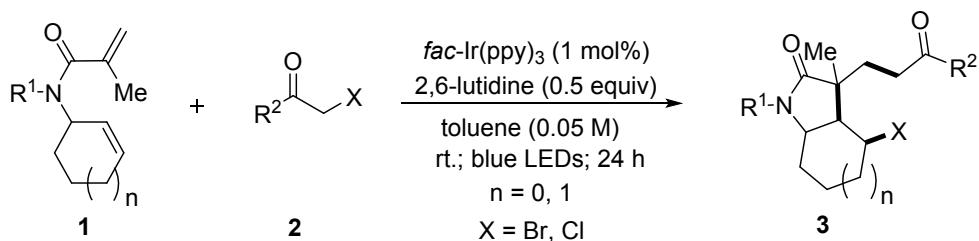

According to a modified literature procedure,³ methacryloyl chloride (2 equiv) in toluene (0.13 M) was added on a mixture of amine **S2** (1 equiv), triethylamine (2 equiv) and DMAP (0.1 equiv) in toluene (0.13 M). The mixture was stirred overnight at reflux. The reaction was quenched with saturated aqueous Na₂CO₃ (15 mL), then the mixture was extracted with dichloromethane (3 x 15 mL). The combined organic layers were dried over Na₂SO₄, filtered, and concentrated *in vacuo*. The residue was purified by column chromatography on silica gel (PE/EA = 6:1–4:1) affording the corresponding substrate **1**.

4. General procedure for the photocatalytic ATRC reactions

4.1 General procedure for the synthesis of compounds 3

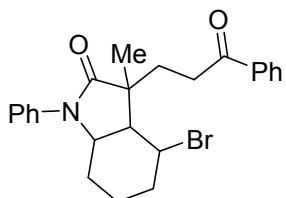

2-Bromo(Chloro)acetophenone **2** (0.12 mmol, 1.2 equiv) and 2,6-lutidine (0.05 mmol, 0.5 equiv) were added to a solution of substrate **1** (0.1 mmol, 1 equiv) and photocatalyst *fac*-Ir(ppy)₃ (1 mol%) in dry toluene (2 mL) at room temperature. The mixture was degassed by three cycles of freeze-pump-thaw and then placed in the irradiation apparatus equipped with a 3 W blue light-emitting diodes (LEDs) strip. The resulting mixture was stirred at room temperature for 24 h. After completion of the reaction, the reaction mixture was concentrated under reduced pressure, and the resulting crude mixture was purified by flash column chromatography on silica gel (PE/EA = 6:1–2:1) to afford the desired product **3**.

4.2 Procedure for scale-up preparation of **3aa**

2-Bromoacetophenone **2a** (6 mmol, 1.19 g, 1.2 equiv) and 2,6-lutidine (2.5 mmol, 0.6 mL, 0.5 equiv) were added to a solution of substrate **1a** (5 mmol, 1.21 g, 1 equiv) and photocatalyst *fac*-Ir(ppy)₃ (32.5 mg, 1 mol%) in dry toluene (50 mL) at room temperature. The mixture was degassed by three cycles of freeze-pump-thaw and then placed in the irradiation apparatus equipped with a 3 W blue LEDs strip. The resulting mixture was stirred at room temperature for 48 h. After completion of the reaction, the reaction mixture was concentrated under reduced pressure, and the resulting crude mixture was purified by flash column chromatography on silica gel (PE/EA = 4:1) to afford the desired product **3aa** (yield 73%, 1.60 g).

7. Mechanistic studies

7.1 Radical trapping experiments

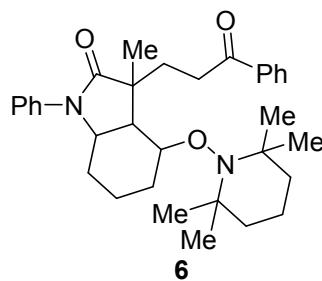

The radical trapping experiments were conducted with different scavengers to capture the radical intermediates in the system, and the products were detected by HRMS. Under the standard conditions, TEMPO-trapped product **5** and **6** were observed when TEMPO was used as the scavenger with no product **3aa** detected (Scheme 4a). This observation indicated the existence of radical intermediates **II** and **IV**. Moreover, both product **3aa** and **7** were observed when H₂O was added to the reaction (Scheme 4b). This observation indicated the existence of carbon cation intermediate **V**.

7.2 Stern-Volmer fluorescence quenching experiments

According to the procedure of related literature, Stern-Volmer fluorescence quenching experiments were run with freshly prepared solutions of 0.1 mM *fac*-Ir(ppy)₃ in toluene at room temperature. The solutions were irradiated at 375 nm and fluorescence was measured from 450 nm to 650 nm. Control experiments show that excited state of *fac*-Ir(ppy)₃ was primarily quenched by 2-bromoacetophenone **2a** while 1,6-dienes **1a** and 2,6-lutidine showed a much less effect.
