**Materials and Instrumentation.** Unless otherwise noted, all reagents were purchased from commercial sources and used without further purification.  $^1\text{H}$  and  $^{13}\text{C}$  NMR spectra were recorded with a Bruker AVANCE DRX400 spectrometer equipped with a BBFO broadband probe. Chemical shifts were measured in ppm ( $\delta$ ) from TMS by residual solvent peaks for  $^1\text{H}$  and  $^{13}\text{C}$ . All the reactions involving gold have been conducted protecting the flask from light with an aluminum foil. The precursor [(NAC)AuCl] has been synthesized as described in literature.<sup>1</sup>

**Synthesis of  $\mathbf{1BF_4}$ .** [(NAC)AuCl] (100 mg, 0.259 mmol) and selenourea (32 mg, 0.259 mmol) were dissolved in dry dichloromethane, under Ar atmosphere, in a flask protected by light. AgBF<sub>4</sub> (55.5 g, 0.285 mmol) were added, causing the immediate formation of a grey-white solid (AgCl and the excess of AgBF<sub>4</sub>). The mixture reaction was stirred for 30 minutes, then the solid was filtered off on a Celite pad and the volume of the solution was reduced to about 2 mL. Adding 5 mL of n-pentane caused the precipitation of a white solid with purple dots, which was filtered, washed with n-pentane (3 - 5 mL) and dried under vacuum. A small aliquot of the solid has been dissolved in 0.7 ml of CDCl<sub>3</sub> passed through activated alumina, in order to remove acid impurities and water. The NMR spectrum of the white portion (see Figure S1) confirms the initial formation of the desired product: the two triplets at 4.0 and 3.3 ppm are typical of the  $\alpha$  protons of the pyrrolidine, together with the two multiplets around 2.0 ppm.<sup>2</sup> The singlet at 1.6 ppm is due to the tert-butyl group and the two broad signals 6.7 and 4.7 ppm are in agreement with a coordinated selenourea (if not coordinated, only one broad peak is present<sup>3</sup>). Anyway, the shape of the peaks underlines the presence of a second set of signals, likely due to the decomposition of the system. Indeed, the color of the solvent turned to purple, with the final formation of metallic gold in the tube and unidentified products in solution.

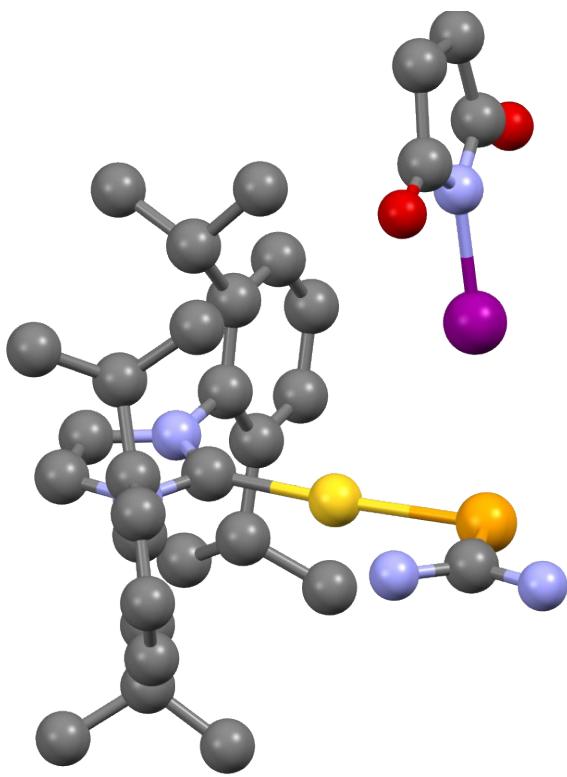

**Figure S1.** <sup>1</sup>H NMR spectrum of [(NAC)Au(SeU)]BF<sub>4</sub> in dry CDCl<sub>3</sub> (400 MHz, 23°C).

**Table S1.** Energy Decomposition Analysis results for the coordinative and noncovalent bonds.
