Note 1

We now show that the previous charge overlap analysis for hydronium¹ does not extend to the case of hydroxide. Figure S1 shows the charge overlap analysis in the case of a hydronium and hydroxide ion in panels (a) and (b) respectively. To simulate the charge density of the slab and solvent in isolation, continuum solvation and an excess surface charge via VASPsol was used on the two systems separately.

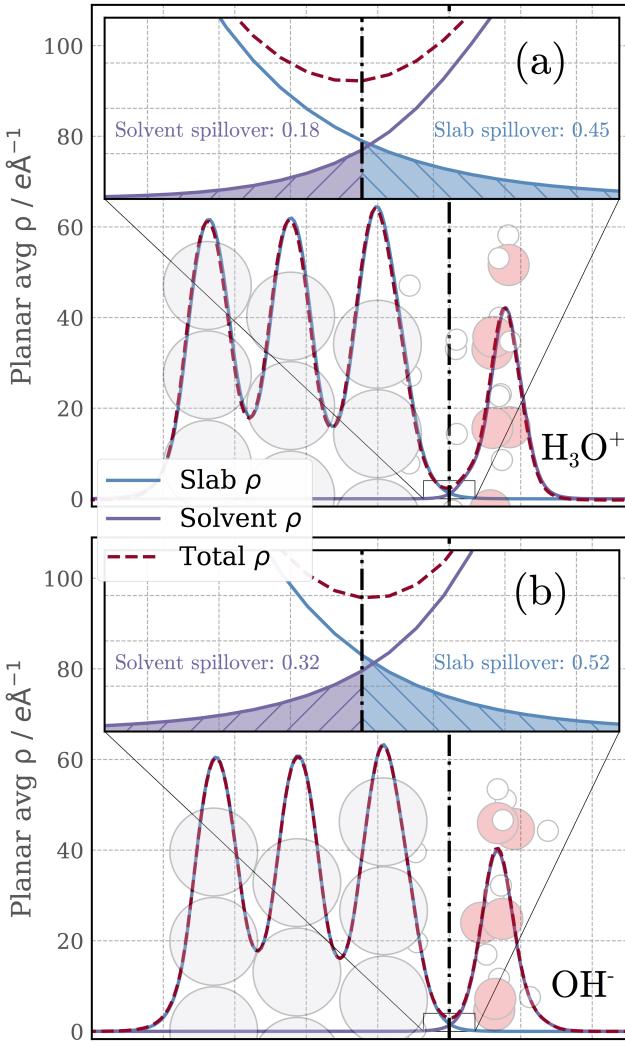

Figure S1: Charge density overlap analysis for the case of (a) hydronium and (b) hydroxide. In the case of hydronium, the slab, with an excess charge of -1.0 e , spills 0.45 electrons into the electrolyte region, while the electrolyte, with an excess charge of 1.0 e , only spills 0.18 electrons into the slab region. This results in a net charge of $1.0 - (0.45 - 0.18) = 0.73 \text{ e}$ on the hydronium ion, in close agreement with Bader charge partitioning. However, in the case of hydroxide, a similar analysis predicts an ion charge of -1.2 e , in contrast to the predicted -0.8 e from Bader.

While the charge overlap analysis for hydronium agrees quite well with the predicted ionic charge from Bader analysis, as outlined in our previous work,¹ the same analysis does not extend to the case of hydroxide. Figure S1(a) shows that in the case of hydronium, the slab electron density spilling into the electrolyte region results in a loss of $0.45\text{ }e$, while the solvent density in the slab region results in a gain of $0.18\text{ }e$, for a total net charge of $1.0 - (0.45 - 0.18) = 0.73\text{ }e$ on the hydronium ion. At the GGA level, Bader predicts an ionic charge of $0.73\text{ }e$, and at the hybrid level $0.77\text{ }e$, within the previously stated error margin of $0.05\text{ }e$. However, a similar argument in the case of hydroxide (panel (b) of Figure S1) shows that the predicted ionic charge of hydroxide from charge overlap is $-1.2\text{ }e$, while Bader predicts $-0.8\text{ }e$. We hypothesize that this is due to the closer proximity of the outer Helmholtz plane to the surface in the case of hydroxide. Even when the surface is fully covered by hydrogen, the solvent bilayer interacts strongly with the surface, with one water molecule arguably physisorbed to the surface, which affects the extracted charge. The slab density then has a larger spillover region into the solvent, despite having a more positive surface charge in the case of hydroxide. The close proximity combined with the ambiguously defined cutoff between the electrolyte and slab regions therefore make the charge overlap analysis less reliable in the case of hydroxide. In such a case, the densities of the slab and solvent cannot simply be added separately to obtain an accurate ionic charge. Nonetheless, we note that because the charge of hydroxide quickly approaches $-1.0\text{ }e$ at both the GGA and hybrid levels as the ion is moved away from the surface, the non-unity charge observed in the outer Helmholtz plane is not due to DFT self-interaction errors.

Note 2

In Figure S2, we show the projected densities of states of the hydroxide containing water bilayer near a platinum surface. The electrolyte LUMO states are clearly visible above the Fermi level.

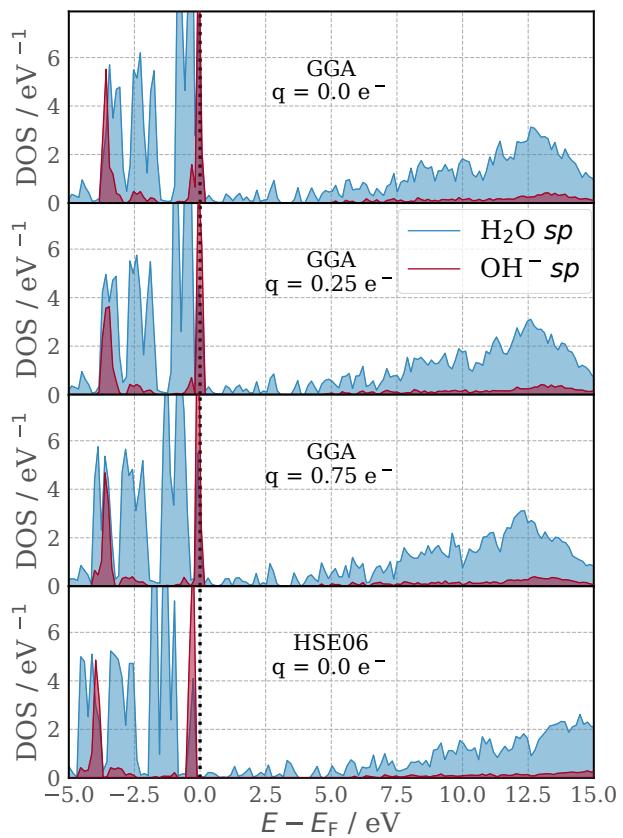

Figure S2: Expanded view of projected densities of states for a water bilayer containing one hydroxide ion near the interface.

Note 3

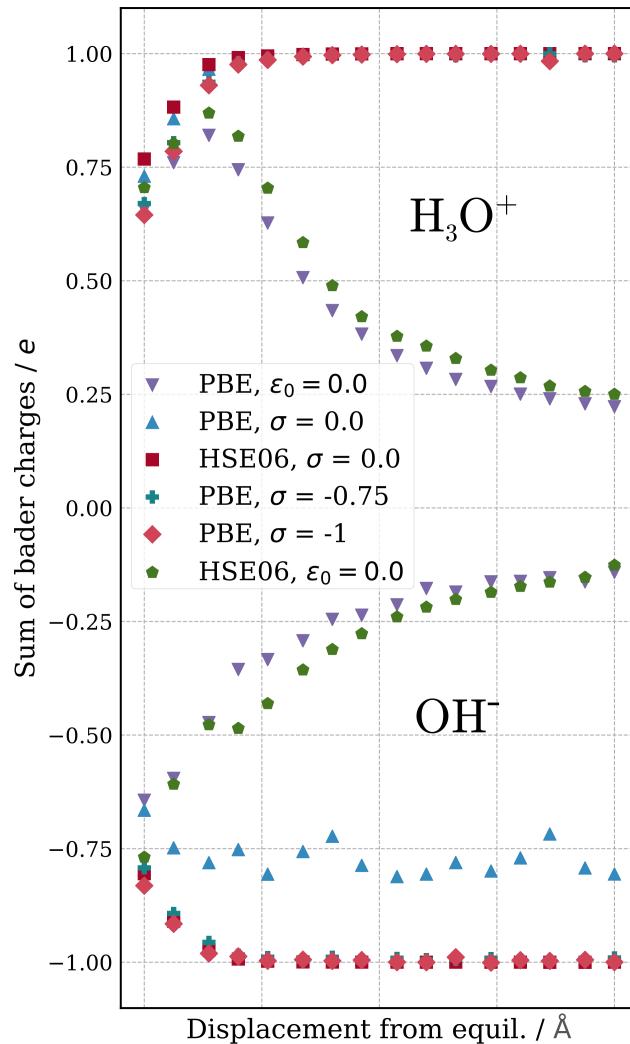

Figure S3: Expanded charging plot illustrating the decay of hydroxide and hydronium charge far from the surface without the dielectric continuum present to stabilize the ion, as found in Ref. 2 by Andreussi et al.

Note 4

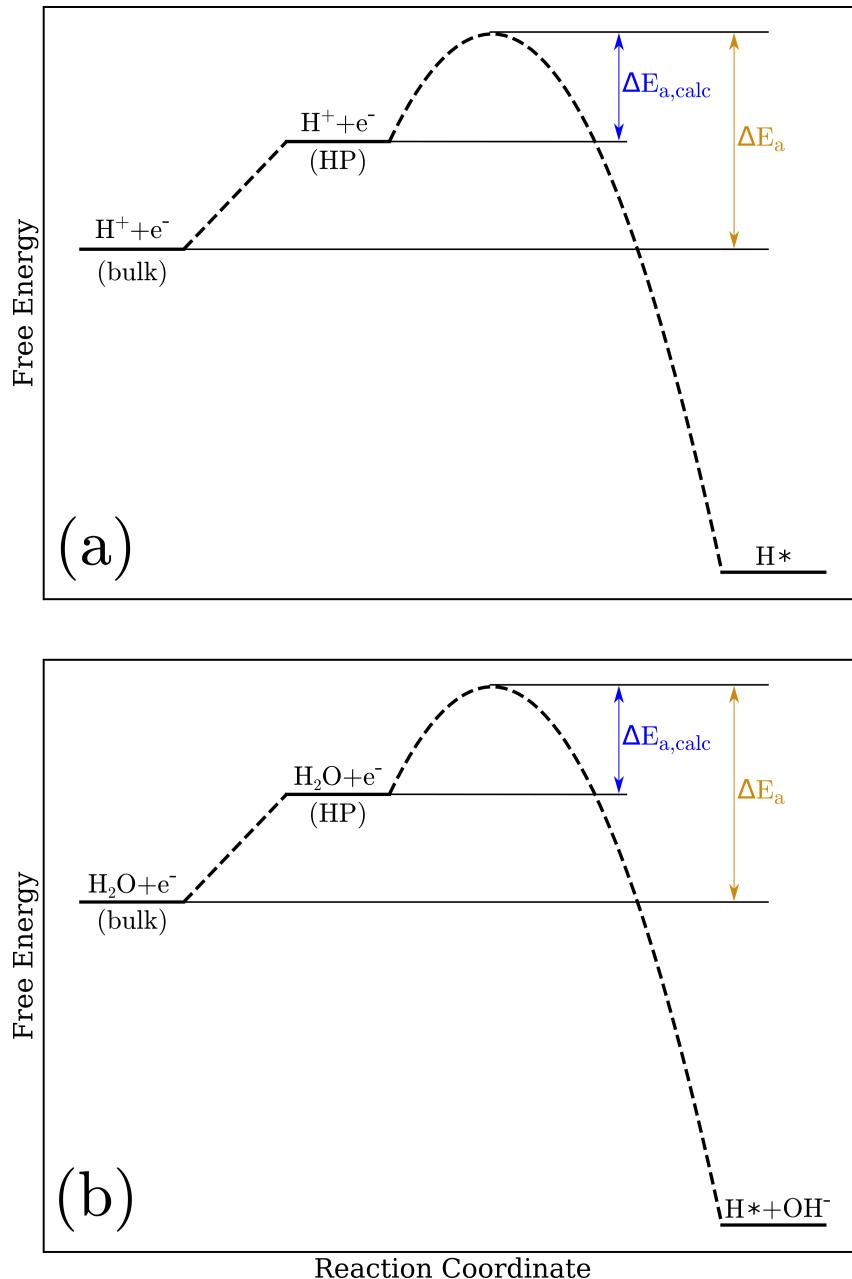

Figure S4: Illustration of appropriate referencing in the calculation of electrochemical barriers for (a) the case of hydronium, and (b) the case of hydroxide. The electrochemical reaction barrier as measured from the calculation's initial state is shown in blue as $\Delta E_{a,\text{calc}}$ while the appropriately references electrochemical reaction barrier is shown in orange as ΔE_a . The lack of equilibrium between the initial state of the calculation (with the ion in the Helmholtz Plane (HP)), and the true initial state (with the ion in the bulk, far from the surface) is shown by the difference in free energy between the two states.
