I. Experimental Procedures

Electrochemical Measurements: The electrochemical tests were conducted on an electrochemical workstation (CHI760E, CH Instrument) with a conventional three electrode cell. A Pt plate was employed as the counter electrode and an Ag/AgCl electrode was used as the reference electrode. The working electrode was prepared on fluorine-doped tin oxide (FTO) glass that was cleaned by sonication in ethanol for 30 min and dried at 353 K. The boundary of FTO glass was protected using the scotch tape. The 5 mg sample and 30 μL Nafion solution (5 wt%) were dispersed in 1 mL of DMF by sonication to get slurry. Then, 40 μL of slurry was spread onto the pretreated FTO glass. After air at room temperature, the working electrode was further dried at 393 K for 2 h to improve adhesion. Then, the scotch tape was unstuck, and the uncoated part of the electrode was isolated with epoxy resin. The exposed area of the working electrode was 0.25 cm^2 . The photocurrent measurements were carried out with the electrolyte was 0.2 M aqueous Na_2SO_4 solution. The electrochemical impedance spectroscopy (EIS) measurements were performed in 0.2 M aqueous Na_2SO_4 solution by applying an AC voltage with -1.3 mV amplitude in a frequency range from 1 Hz to 100 kHz. The polarization curve is performed in the same above mentioned three-electrode system, while the bias sweep range is from -1.6 to 0 V vs Ag/AgCl the electrolyte was 0.2 M aqueous Na_2SO_4 solution.

II. Supplementary illustrations and explanations

Scheme S1. The schematic illustration for the preparation of Fe_2N and $g-C_3N_4$ nanosheets.

Note: Scheme S1 c is the concrete step and matters need attention of the synthesis of Fe_2N nanoparticles by Prussian Blue nanocubes.

Fig. S1 (a) TEM and (b) HRTEM images of Fe₂N nanoparticles. (c) The diameters statistic histogram of Fe₂N Nanoparticles.

Fig. S2 The EDS mapping of the Fe₂N nanoparticles.

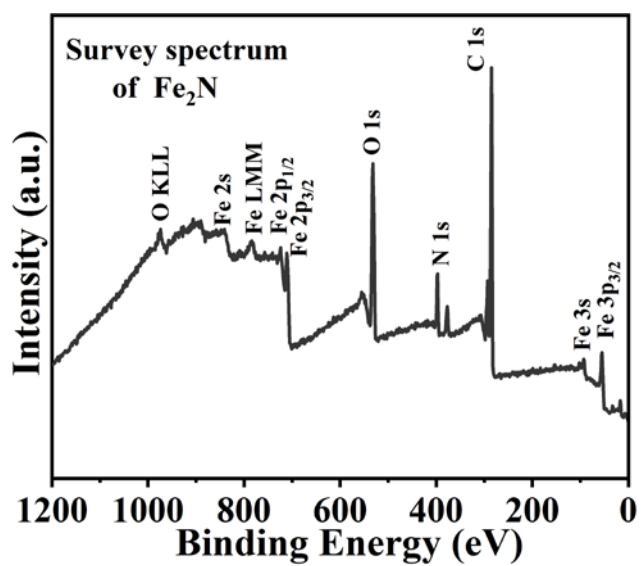

Fig. S3 The X-ray photoelectron survey spectrum of Fe₂N nanoparticles.

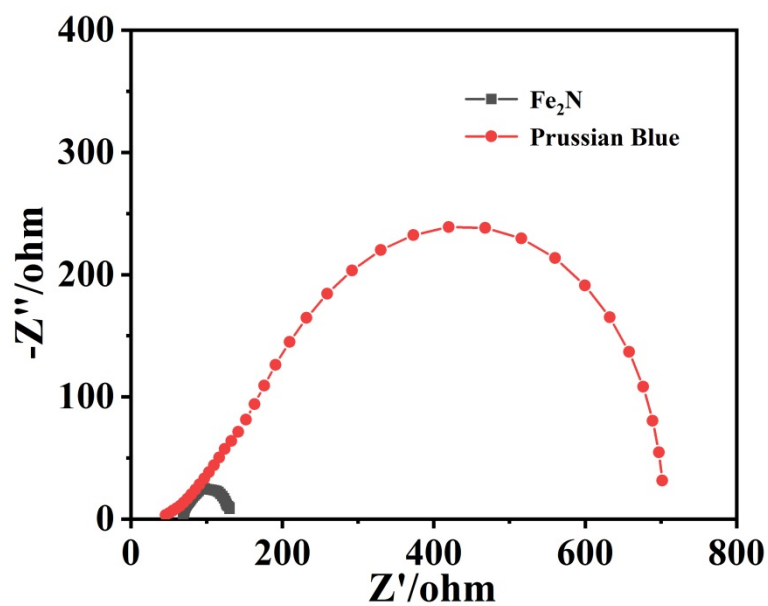

Fig. S4 Electrical impedance spectra of Prussian Blue nanocubes and Fe_2N nanoparticles.

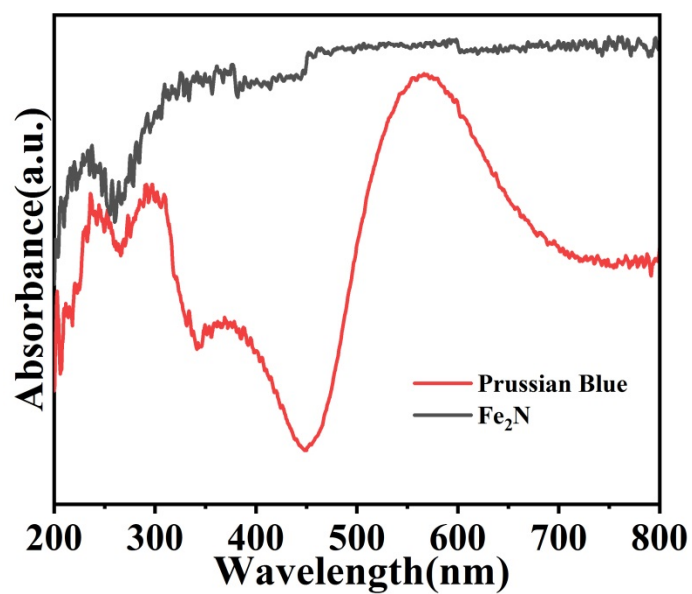

Fig. S5 UV-vis absorption spectra of Prussian Blue nanocubes and Fe_2N nanoparticles.

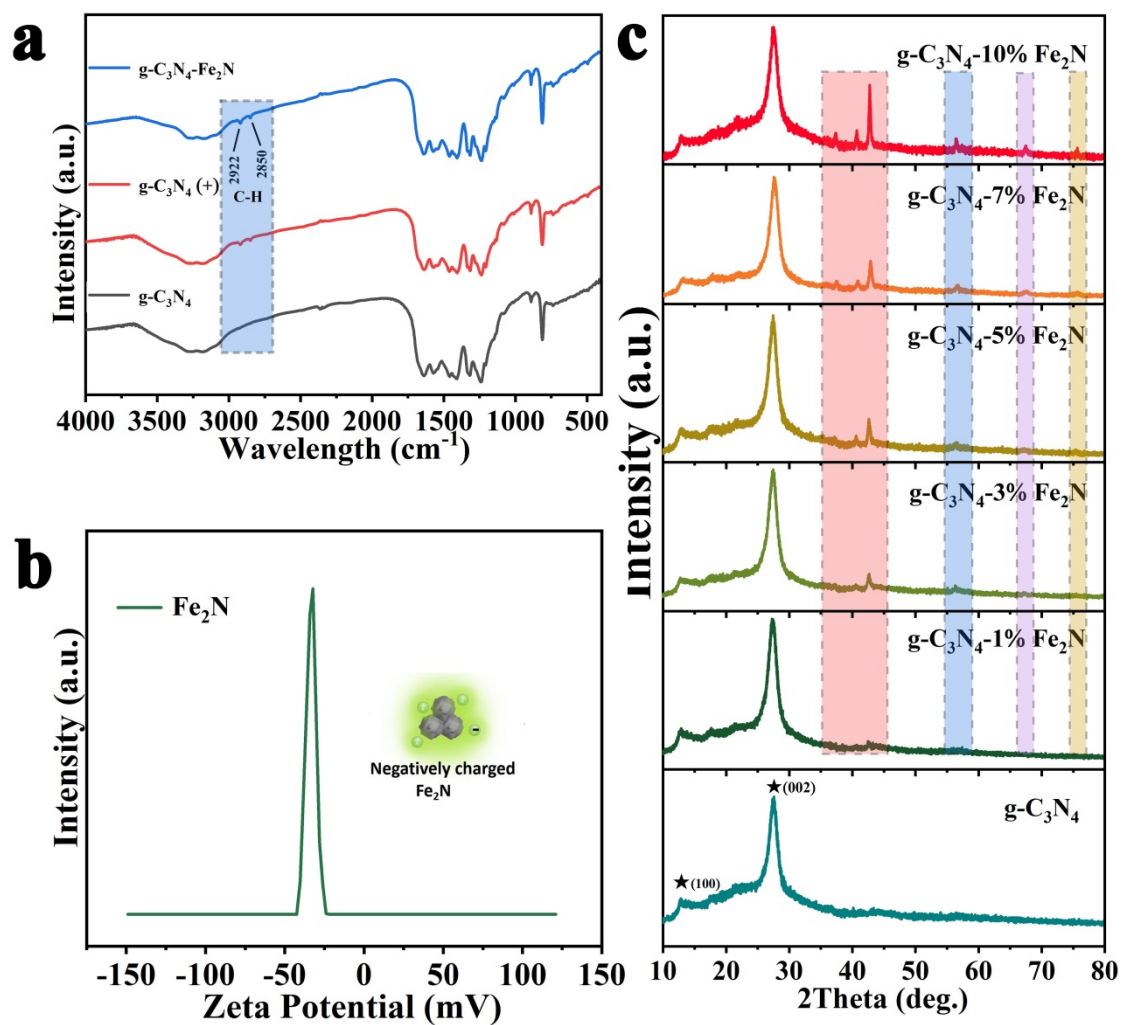

Fig. S6 (a) The FT-IR spectra of pure $\text{g-C}_3\text{N}_4$, CTAB modified $\text{g-C}_3\text{N}_4$ and $\text{g-C}_3\text{N}_4\text{-Fe}_2\text{N}$ nanocomposites. (b) Zeta potential measurements of Fe_2N nanoparticles. (c) XRD pattern of pure $\text{g-C}_3\text{N}_4$ and a series of $\text{g-C}_3\text{N}_4\text{-Fe}_2\text{N}$ nanocomposites.

Fig. S7 HRTEM image of pure g-C₃N₄ nanosheets.

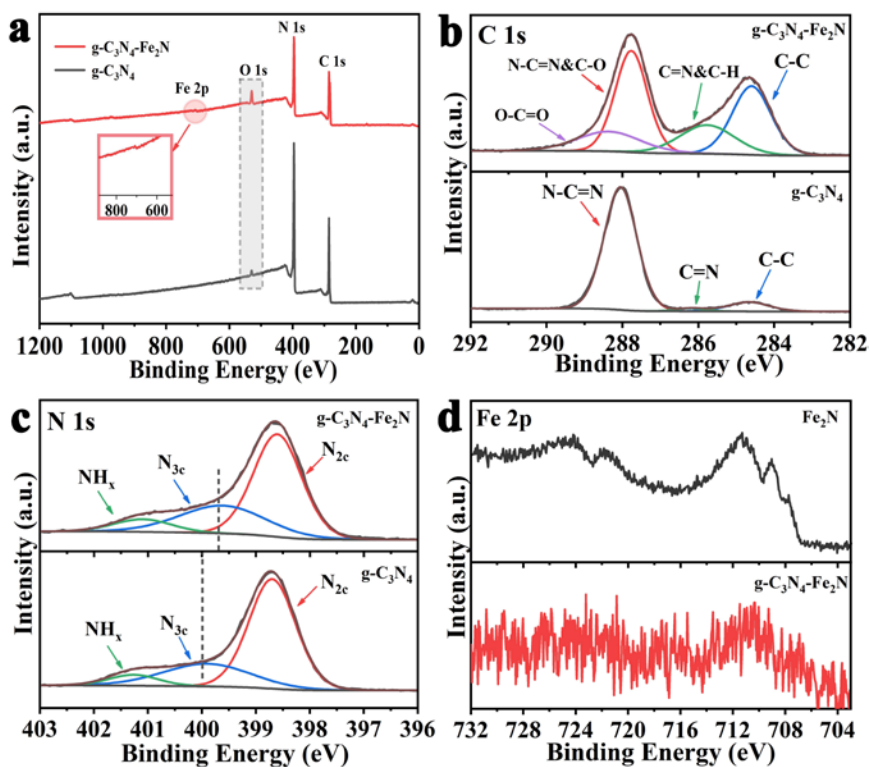

Fig. S8 (a) The X-ray photoelectron survey spectrum of $g\text{-C}_3\text{N}_4$ and $g\text{-C}_3\text{N}_4\text{-Fe}_2\text{N}$. High-resolution spectrum of (b) C 1s and (c) N 1s for $g\text{-C}_3\text{N}_4$ and $g\text{-C}_3\text{N}_4\text{-Fe}_2\text{N}$. High-resolution spectrum of (d) Fe 2P for $g\text{-C}_3\text{N}_4\text{-Fe}_2\text{N}$ and pure Fe_2N .

Note: The peak of O 1s of the $g\text{-C}_3\text{N}_4\text{-Fe}_2\text{N}$ nanocomposite is an obvious stronger than that of the pure $g\text{-C}_3\text{N}_4$, in the survey spectrum. It has been proved to be the result of the modification on the surface of the $g\text{-C}_3\text{N}_4$ by the CTAB. Meanwhile, the $g\text{-C}_3\text{N}_4\text{-Fe}_2\text{N}$ nanocomposite has an extra peak at 708 eV corresponding to the Fe 2p.

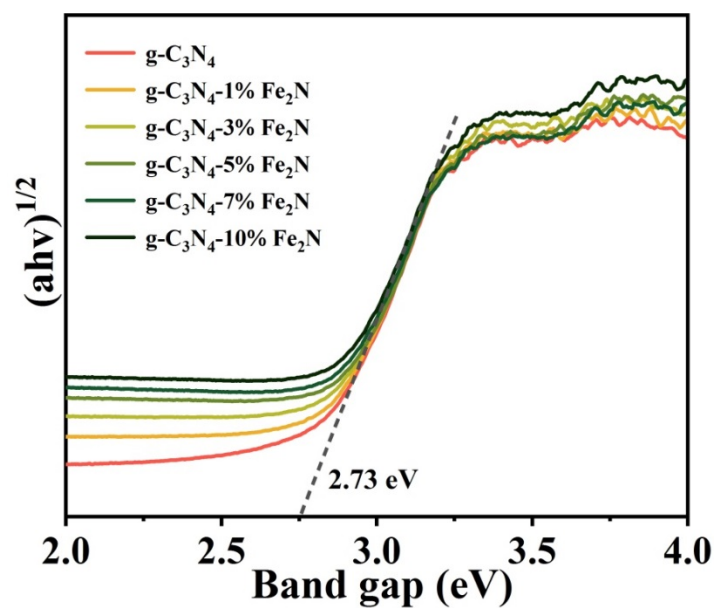

Fig. S9 Tauc plots of the UV-vis spectra for a series of samples.

Fig. S10 Time-dependent photocatalytic H₂ evolution over the g-C₃N₄-Fe₂N nanocomposites with different ratio of Fe₂N.

Fig. S11 Stability examination of H₂ production (evacuation every 3 h) for the g-C₃N₄-7%Fe₂N sample.

Fig. S12. The SEM image of the reacted g-C₃N₄-7%Fe₂N sample.

Fig. S13. N_2 adsorption–desorption isotherms and the corresponding pore size distribution curves (inset) of $g-C_3N_4$ and $g-C_3N_4-7\%Fe_2N$.

Table S1. Pore Structure Parameters of $g-C_3N_4$ and $g-C_3N_4-7\%Fe_2N$.

Photocatalyst	BET surface area ($m^2 g^{-1}$)	mean pore diameter (nm)	pore volume ($cm^3 g^{-1}$)
$g-C_3N_4$	97.96	14.66	0.38
$g-C_3N_4-7\%Fe_2N$	81.11	16.49	0.44

Table S2. Representative summary on photocatalytic activity of non-noble based photocatalysts toward water splitting H₂ evolution.

Photocatalyst	Co-catalysts/ mass ratio	Light source	Reaction conditions	PHER rate ^a	Ref.
g-C ₃ N ₄	Ni _x P _y /5 wt%	Xe light 300W, λ>420 nm	Aqueous TEOA solution (25%)	34	[S1]
CdS	NiC /1 wt%	Xe light 350W, λ>420 nm	Aqueous solution of Na ₂ S (0.25 M) and Na ₂ SO ₃ (0.25 M)	7.76	[S2]
CdS/g-C ₃ N ₄	Ni(OH) ₂ / 4.76 wt%	Xe light 300W, λ>420 nm	Aqueous solution of Na ₂ S (0.5 M) and Na ₂ SO ₃ (0.7 M)	25.65	[S3]
ZnIn ₂ S ₄	MoC-QDs/C / 2.5 wt%	Xe light 300W, λ>400 nm	Aqueous lactic acid solution (10%)	48	[S4]
g-C ₃ N ₄	CoO	Xe light 300W, λ>400 nm	Aqueous lactic acid solution (10%)	3	[S5]
CdS	Mo ₂ C@C / 2 wt%	Xe light 300W, λ>420 nm	Aqueous lactic acid solution (10%)	26	[S6]
g-C ₃ N ₄	Ni _x Co _{1-x} S ₂ / 5 wt%	White LED, λ>420 nm	Aqueous TEOA solution (15%), Eosin Y-sensitized catalyst (10mg)	9.08	[S7]
CdS	MoS ₂ / 2 wt%	Xe light 300W, λ>420 nm	Aqueous lactic acid solution (10%)	64.9	[S8]
g-C ₃ N ₄	Fe ₂ N / 7 wt%	Xe light 300W, λ>400 nm	Aqueous TEOA solution (10%)	48	This work

Note: ^aPHER rate denotes the hydrogen evolution rate of times higher than pristine photocatalyst.
