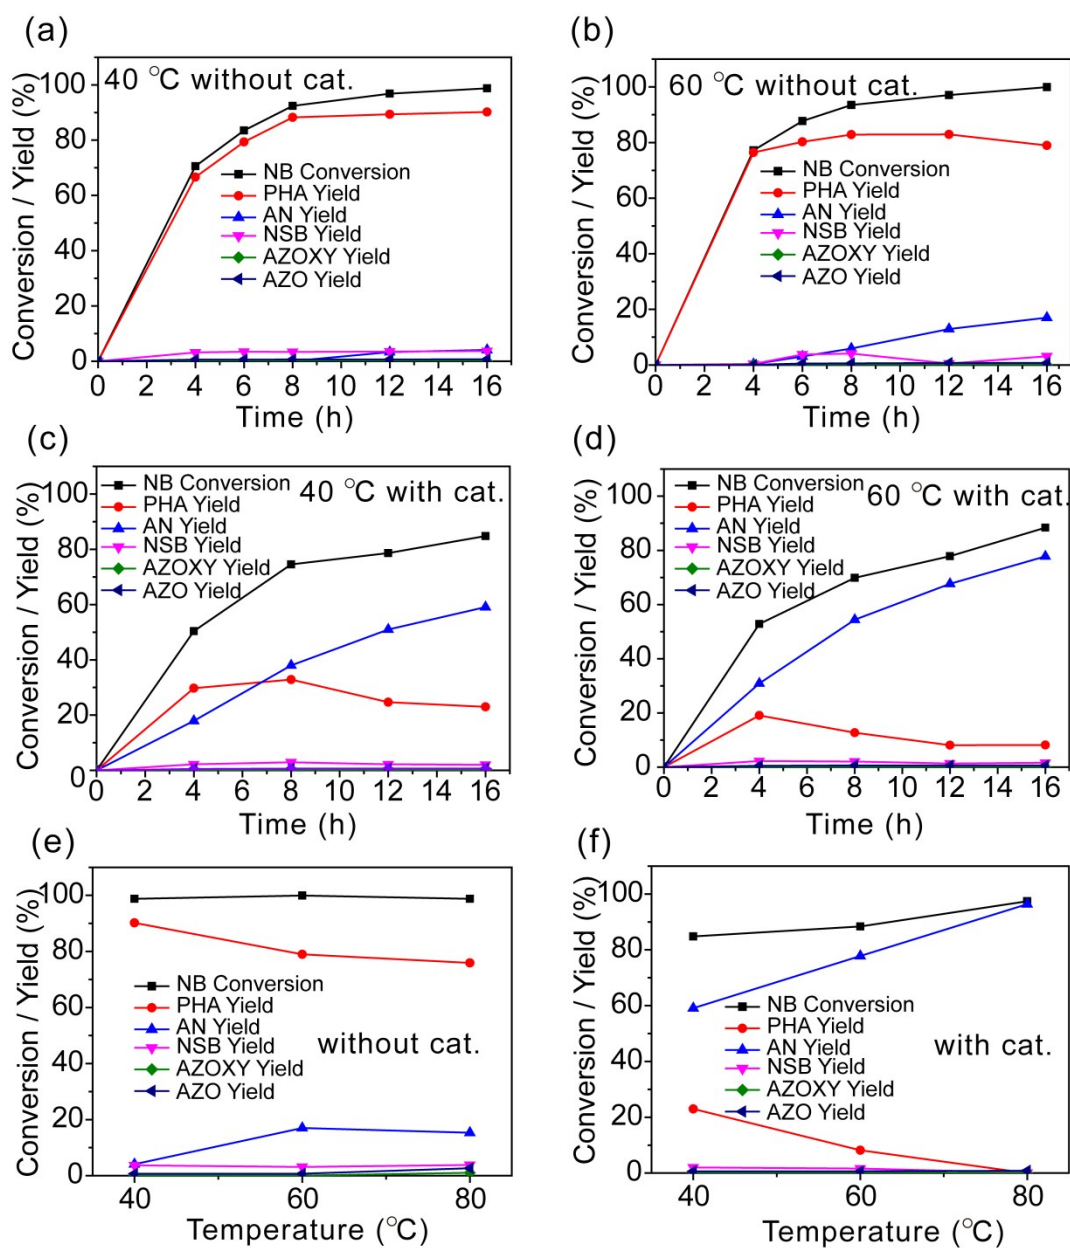

Fig. S5 Kinetic plots for nitrobenzene reduction under near-UV light irradiation without ZnNb_2O_6 as catalyst at 40 °C (a) and 60 °C (b). Kinetic plots for nitrobenzene reduction under near-UV light irradiation with ZnNb_2O_6 as catalyst at 40 °C (c) and 60 °C (d). Reaction conditions: 30 mg of catalyst (if applicable), near-UV light (380 - 420 nm, peak at 399 nm, 100 mW cm^{-2}), 2 ml of 0.05 M nitrobenzene in isopropyl alcohol solution. The effect of temperature on the nitrobenzene reduction reaction without (e) or with ZnNb_2O_6 (f). The experiments are proceeded for 16 h at 40 °C, 60 °C and 80 °C, respectively.

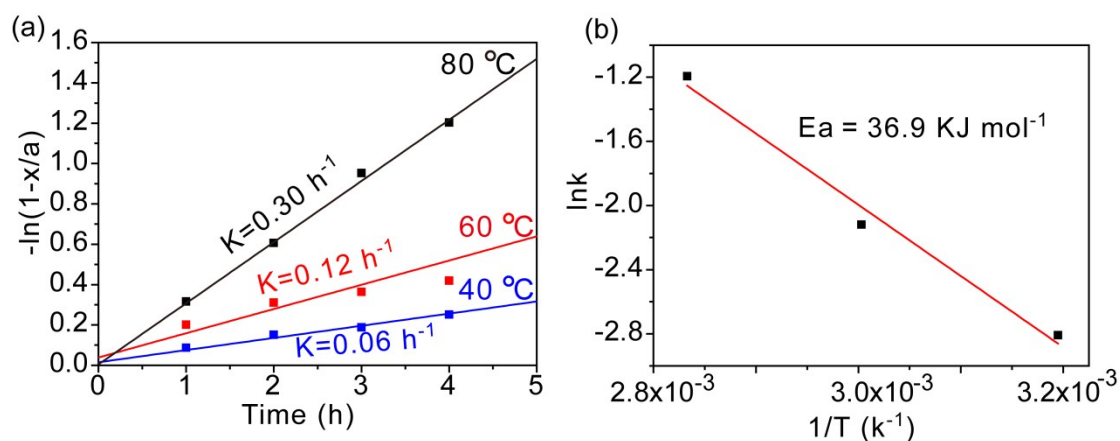

Fig. S6 (a) Kinetic plots of $-\ln(1-x/a)$ versus reaction time t with ZnNb_2O_6 catalyst at different temperature: 40, 60 and 80 °C. (b) Plot of the $\ln k$ versus $1/T$ according to the Arrhenius equation.

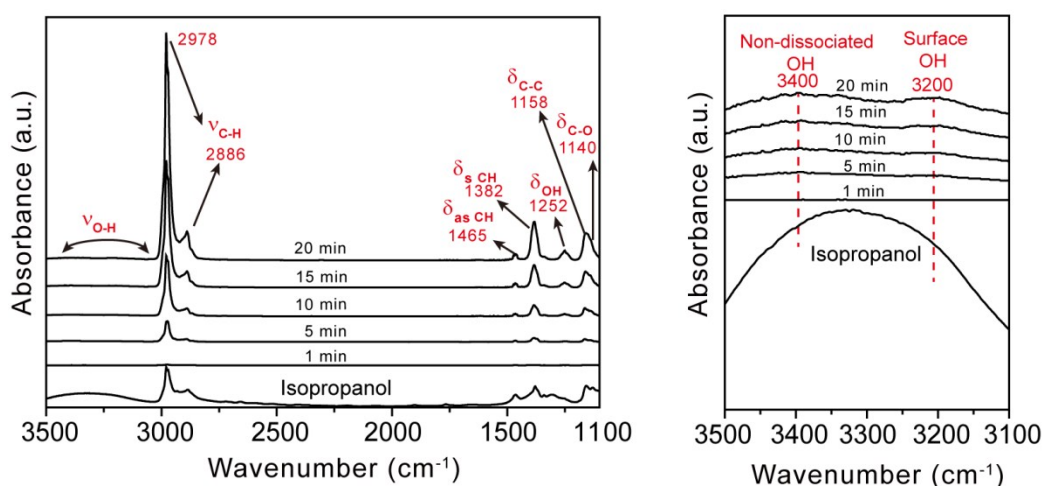

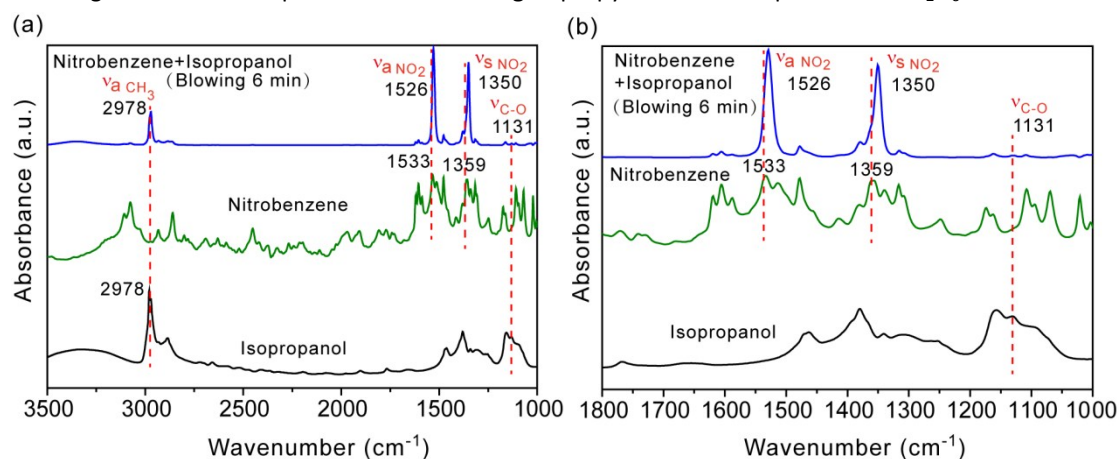

Calculation details of activation energy:

At first, the conversions for phenylhydroxylamine to aniline were counted at different periods of reaction time in 5 h. According to the first-order rate law equation,¹ the kinetic plots of $-\ln(1-x/a)$ versus reaction time t make several straight lines at different temperature: 40, 60 and 80 °C (x is the productive amounts of aniline, a is the amounts of phenylhydroxylamine by direct irradiation for 6 h with near-UV light). The values of the slopes calculated from the kinetic plots, as shown in Fig. S6a, are equal to the value of the rate constant k . According to the Arrhenius equation, one straight line of $\ln k$ versus $(1/T)$ was obtained (Fig. S6b), from which the activation energy of hydrogenation of phenylhydroxylamine with ZnNb_2O_6 could be calculated from the value of the slope value ($-E_a/R$), being 36.9 KJ mol^{-1} .

Table S1 Product distribution over modulation of PHA selectivity.

Entry	NB Con. (%)	PHA	AN	NSB	AZOXY	AZO
		Yield (%)				
Solution-A	99	76	15	4	2	3
1 ^a	99	24	31	3	41	1
2 ^b	99	28	38	3	10	21
3 ^c	99	70	17	5	1	7

The reaction was conducted under argon atmosphere at 80 °C using 2 ml of isopropyl alcohol solution with 0.1 mmol of nitrobenzene under near-UV light irradiation (Light intensity: 100 mW cm⁻²) for 16 h in the first reaction stage (designated as Solution-A). In the second reaction stage, 30 mg of ZnNb₂O₆ was added to Solution-A in glove box. After that, the reaction was conducted continually for 16 h under ^adark and ^blight situation; ^cthe Solution-A was conducted continually for 16 h under near-UV light irradiation.

**Fig. S7** *In situ* FT-IR spectra recorded during isopropyl alcohol adsorption on ZnNb₂O₆ at 80 °C.**Fig. S8** (a) FT-IR absorbance spectra recorded during isopropyl alcohol and nitrobenzene adsorption on ZnNb₂O₆. (b) The amplified spectra for (a) at 1800-1000 cm⁻¹. The standardized spectra of isopropyl alcohol or nitrobenzene were obtained based on KBr background at room temperature. The spectra of isopropyl alcohol and nitrobenzene were obtained by blowing the closed cell for 6 min after 10 μL of 0.05 M nitrobenzene in isopropyl alcohol was added to the centre of the situ cell at 80 °C.
