## S1 Single crystal X-ray diffraction

Crystals were mounted on glass fibres (1, 2, 3 and 5) or on top of a human hair (both polymorphs of 4) in per-fluorinated inert oil. Data were recorded on an Oxford Diffraction Nova A diffractometer using mirror-focused $\mathrm{Cu} \mathrm{K}_{\alpha}$ radiation. Absorption corrections were based on multi-scans and for compound 1 and the monoclinic polymorph of $\mathbf{4}$ additional absorption correction based on face indexing and integration on a Gaussian grid was applied. Data reduction was performed with CrysalisPro. ${ }^{[1]}$ The structures were solved by intrinsic phasing with SHELXT-2014/5 ${ }^{[2]}$ (1 and the monoclinic polymorph of $\mathbf{4}$ ) or SHELXS-97 ${ }^{[3]}$ (2, 3, the triclinic polymorph of $\mathbf{4}$ and $\mathbf{5}$ ) and refined on $\mathrm{F}^{2}$ using the program SHELXL-2018/3 ${ }^{[4]}$. H atoms in all the reported crystal structures were placed in idealized positions and refined using a riding model. Exceptions are noted in the following special features section.

Complete data have been deposited at the Cambridge Crystallographic Data Centre under the numbers 1870526-1870531.

These data can be obtained free of charge from www.ccdc.cam.ac.uk/data_request/cif.

## Special Features

Compound 1: The $\mathrm{C}_{5} \mathrm{Me}_{5}$ as well as the allyl ligand were refined with a discrete disorder model. SADI restraints were applied to the $\mathrm{C}_{5} \mathrm{Me}_{5}$ moiety which was showing an occupation of $51 \%$ for the major component. The major component of the allyl moiety was occupied by $85 \%$.

Compound 3: The hydridic hydrogens atoms were refined freely with a SADI restraint on the ruthenium hydrogen distances.

Compound 4 (triclinic): One isopropyl group is disordered and was refined on two positions (SADI and ISOR restraints were applied).

Figure S1. Molecular structure of compound $\mathbf{3}$ with thermal displacement parameters drawn at $50 \%$ probability. Hydrogen atoms except of H 01 and $\mathrm{H} 01^{‘}$ are omitted for clarity. Selected bond lengths [ $\AA$ ] and angles [ ${ }^{\circ}$ ]: Ru1-Ru2 2.7066(3), Ru1-N 2.142(2), Ru2-N 2.152(2), Ru1-C21 2.037(3), Ru2-C21 2.014(3), Si1-C21 1.902(3), Si1-N 1.743(2), Si2-N 1.723(2), Si1-C21-Ru1 85.94(11), Si1-C21-Ru2 86.92(11), Ru2-C21-Ru1 83.83(10), Ru2-N-Ru1

 Ru1‘ 87.06(11), Si1‘-C21‘-Ru2‘ 86.15(11), Ru2‘-C21‘-Ru1‘ 84.04(10), Ru2‘-N‘-Ru1‘ 77.74(7).

Two different polymorphs of compound 4 were obtained. A triclinic structure measured at 130 K and a monoclinic one measured at 100 K (see Figures S2 and S3 for packing diagrams). Both structures show a very distinct $\mathrm{C}-\mathrm{H} . . . \pi$ contact between one of the hydrogen atoms at the NHC backbone and the Cp* ligand. The triclinic polymorph shows an additional contact between the Ruthenium atom and the para-hydrogen atom of a Dipp substituent whereas the corresponding distance in the monoclinic polymorph is significantly larger (see table S2 for metrical parameters).

Table S2. Metrical parameters of the two polymorphs of complex 4.

| polymorph | $\mathrm{C} 19-\mathrm{H} 19$ | $\mathrm{H} 19 \cdots \mathrm{Ru} 1$ | $\mathrm{C} 19 \cdots \mathrm{Ru} 1$ | $\mathrm{C} 19-\mathrm{H} 19 \cdots \mathrm{Ru} 1$ |
| :---: | :---: | :---: | :---: | :---: |
| triclinic | $0.95 \AA$ | $3.1215(4) \AA$ | $4.0475(19) \AA$ | $165.30(15)^{\circ}$ |
| monoclinic | $0.95 \AA$ | $3.3075(3) \AA$ | $4.122(2) \AA$ | $145.03(15)^{\circ}$ |
|  | $\mathrm{C}-\mathrm{H}$ | $\mathrm{H} \cdots$ Centroid | $\mathrm{C} \cdots{ }^{\circ} \mathrm{Centroid}$ | $\mathrm{C}-\mathrm{H}^{\circ} \mathrm{Centroid}^{\prime}$ |
| triclinic | $0.95 \AA$ | $2.5458(10) \AA$ | $3.485(3) \AA$ | $169.72(14)^{\circ}$ |
| monoclinic | $0.95 \AA$ | $2.6206(9) \AA$ | $3.530(2) \AA$ | $160.43(15)^{\circ}$ |

Figure S2. Packing diagram of the triclinic polymorph of 4 with thermal displacement parameters drawn at $50 \%$ probability. Hydrogen atoms except of H3 and H19 are omitted. The following symmetry operation have been applied: i) $x, 1+y, z$ (translation), ii) $1-x, 2-y, 1-$ $z$ (inversion) iii) $x, 2+y, z$ (translation).

Figure S3. Packing diagram of the triclinic polymorph of 4 with thermal displacement parameters drawn at $50 \%$ probability. Hydrogen atoms except of H 3 and H 19 are omitted. The following symmetry operation have been applied: i) $2-\mathrm{x}, 1-\mathrm{y}, 1-\mathrm{z}$ (inversion), ii) $1+\mathrm{x}, \mathrm{y}, \mathrm{z}$ (translaion) iii) 1-x, 1-y, 1-z (inversion), iv) 3-x, 1-y, 1-z (inversion).

Figure S4. Molecular structure of compound 4 (monoclinic polymorph) with thermal displacement parameters drawn at $50 \%$ probability. Hydrogen atoms are omitted for clarity. Selected bond lengths $[\AA ̊]$ and angles [ ${ }^{\circ}$ ]: Ru-N3 1.8597(18), Ru-Cp* centroid 1.7609(10), N3C1 1.291(3), N1-C1 1.381(3), N2-C1 1.384(3), Cp* ${ }_{\text {centroid }}-\mathrm{Ru}-\mathrm{N} 3$ 172.61(7), Ru-N3-C1 166.18(16), N3-C1-N1 127.70(19), N3-C1-N2 128.00(18), N2-C1-N1 104.30(18).

## S4 Computational Details

All computations were performed using the density functional method M06-L as implemented in the Gaussian09 program. ${ }^{[5]}$ For all elements ( $\mathrm{C}, \mathrm{H}, \mathrm{N}, \mathrm{Si}$ and Ru ) the newer redefinitions of Ahlrichs triple- $\zeta$ basis sets def2-TZVP ("Karlsruhe basis sets") were applied. ${ }^{[6]}$ The QTAIM analysis of the wave function was performed using the freely available program package MultiWFN $3.6^{[7]}$ and the binding analysis of complex $\mathbf{4}$ was done with the free program GaussSum 3.0. ${ }^{[8]}$ Calculations have been carried out in the gas phase.
