

Supporting Information for:

Isostructural iron(III) spin crossover complexes with a tridentate Schiff base-like ligand: X-ray structures and magnetic properties

Katja Dankhoff and Birgit Weber*

Department of Chemistry, University of Bayreuth, Universitätsstr. 30, 95447 Bayreuth, Germany. E-mail: weber@uni-bayreuth.de; Tel: +49(0)921552555

Experimental:

The ligand HL was synthesised as published previously.¹ All other chemicals were commercially available and used without further purification. CHN analyses were measured with a Vario El III from Elementar AnalysenSysteme. Samples were prepared in a tin boat, and acetanilide was used as standard. Mass spectra were recorded with a Finnigan MAT 8500 with a data system MASPEC II. IR spectra were recorded with a Perkin Elmer Spectrum 100 FT-IR spectrometer.

[FeL₂]BF₄ (**1**). HL (0.2 g, 0.9 mmol, 1 eq), sodium acetate (0.05 g, 0.9 mmol, 1 eq), and iron(III) nitrate nonahydrate (0.22 g, 0.55 mmol, 0.6 eq) were dissolved in ethanol (20 mL) and the resulting purple solution was heated to reflux for 1 h. After cooling to room temperature, approximately half of the solvent was removed under reduced pressure. Sodium tetrafluoroborate (1.14 g, 10 mmol, 25 eq) was dissolved in 20 mL water and added to the purple solution. The mixture was stirred at room temperature for 10 min, the resulting purple solid was filtrated, washed with a few mL of water and dried *in vacuo*. Yield: 0.10 g (577.15 g·mol⁻¹, 40 %). Elemental analysis (C₂₄H₂₆BF₄FeN₄O₄, %) measured (calcd.): C 49.32 (49.95), H 4.30 (4.54), N 9.56 (9.71). MS (EI, pos.) *m/z* (%): 490 (C₂₄H₂₆FeN₄O₄, 36), 93 (C₆H₆N, 100) 43 (C₂H₃O, 25). IR: ν = 1579 (s, C=O), 1568 (s, C=O) cm⁻¹.

[FeL₂]ClO₄ (**2**). HL (0.2 g, 0.9 mmol, 1 eq), sodium acetate (0.05 g, 0.9 mmol, 1 eq), and iron(III) nitrate nonahydrate (0.22 g, 0.55 mmol, 0.6 eq) were dissolved in ethanol (20 mL) and the resulting purple solution was heated to reflux for 1 h. After cooling to room temperature, approximately half of the solvent was removed under reduced pressure. Barium perchlorate trihydrate (5.37 g, 10 mmol, 25 eq) was dissolved in 20 mL water and added to the purple solution. The mixture was stirred at room temperature for 10 min, the resulting purple solid was filtrated, washed with a few mL of water and dried *in vacuo*. Yield: 0.14 g (589.79 g·mol⁻¹, 43 %). IR: ν = 1579 (s, C=O), 1567 (s, C=O) cm⁻¹.

Single crystal X-ray structure analysis

X-ray structure analysis of the crystals was performed with a Stoe StadiVari diffractometer using graphite-monochromated MoK α radiation. The data were corrected for Lorentz and polarization effects. The structures were solved by direct methods (SIR-97)² and refined by fullmatrix least-square techniques against Fo²-Fc² (SHELXL-2017).³ All hydrogen atoms were calculated in idealised positions with fixed displacement parameters. ORTEP-III⁴ was used for the structure representation, SCHAKAL-99⁵ to illustrate molecule packing. The Hirshfeld surfaces were mapped with d_{norm} , and 2D fingerprint plots were generated using CrystalExplorer 17.5.⁶ Graphical plots of the molecular Hirshfeld surfaces use a red-white-blue colour scheme. Red highlights contacts shorter than the van der Waals separation, contacts around the van der Waals separation are white, and blue is used for longer contacts.

CCDC (1898802–1898805) contain the supplementary crystallographic data for this paper. These data can be obtained free of charge from The Cambridge Crystallographic Data Centre.

Magnetic measurements

Magnetic measurements on the compounds were carried out using a SQUID MPMS-XL5 from Quantum Design with an applied field of 5000 G, and in the temperature range from 300 to 50 K in settle and in sweep (5 K/min) mode. The sample was prepared in a gelatine capsule held in a plastic straw. The raw data were corrected for the diamagnetic part of the sample holder and the diamagnetism of the organic ligand using tabulated Pascal's constants.⁷
