Crystallographic Experimental

Measurements were made on a Bruker APEXII CCD equipped diffractometer (30 mA, 50 kV) using monochromated Mo K α radiation ($\lambda = 0.71073 \text{ \AA}$) at 125 K by Prof. Jason Masuda (Chemistry Department, St. Mary's University, Halifax, Nova Scotia, Canada). Refinement of the data was performed by Prof. Louise N. Dawe (Department of Chemistry and Biochemistry, Wilfrid Laurier University, Waterloo, Ontario, Canada). Structures were solved using Olex2^[1], the structure was solved with the ShelXT^[2] structure solution program using Direct Methods and refined with the ShelXL^[3] refinement package using Least Squares minimisation. H-atoms were introduced in calculated positions and refined on a riding model, while all other atoms were introduced in difference map positions and refined anisotropically. For **3**, two disordered t-butyl groups are present. C56-C58:C56A-C58A at 0.581(8):0.419(8) occupancy and C60-C62:C60A-C62A at 0.731(8):0.269(8) occupancy. Both groups were refined anisotropically with SADI and RIGU restraints. All other non-hydrogen atoms were refined anisotropically, without restraints.
