Section S1: Materials and methods

All materials were purchased from commercially available sources and used without further purification.

Section S2: ZrTCPB Synthesis

Zr TCPB Synthesis:

The reaction mixture containing $\text{Cl}_2\text{OZr} \cdot 8 \text{H}_2\text{O}$ (0.0217 g, 0.067 mmol), 1,2,4,5-Tetrakis(4-carboxyphenyl)benzene (TCPB, 0.0067 g, 0.012 mmol), Benzoic acid (BA, 0.604 g, 4.95 mmol), N,N'-dimethylformamide (DMF, 2.15 mL), was placed in a 20 mL scintillation vial and was heated to 115 °C for 72 hrs, at a rate of 1.5 °C/minute and cooled to room temperature at a cooling rate of 1 °C/minute. Solid was then washed in 50 mL of DMF 3 times and then 3 times in 50 mL of MeOH.

Zr TCPB HCl Washing Method:

50 mg of the white solid precipitate was re-suspended in 20 mL of DMF with 1.5 mL of 8M HCl and was put in the oven for 12 hours at 115 °C. Then the solution was exchanged with 50 mL of acetone. This acetone was replenished several times over the course of 72 hours before sample was re-activated.

Section S3: Gas Sorption Measurements

Prior to measuring the gas adsorption isotherms, the sample was immersed in 15 mL of methanol for 3 days, with the solvent replenished every 24 hrs. Following this treatment, the sample was activated under vacuum on a Micromeritics ASAP 2020 surface area and porosity analyzer, at 30 °C for 6 hrs and then heated to 150 °C at 1 °C/min for 12 hrs. Nitrogen gas adsorption isotherms were measured at 77 K using nitrogen of ultra-high purity (99.999%, obtained from Matheson Tri-Gas).

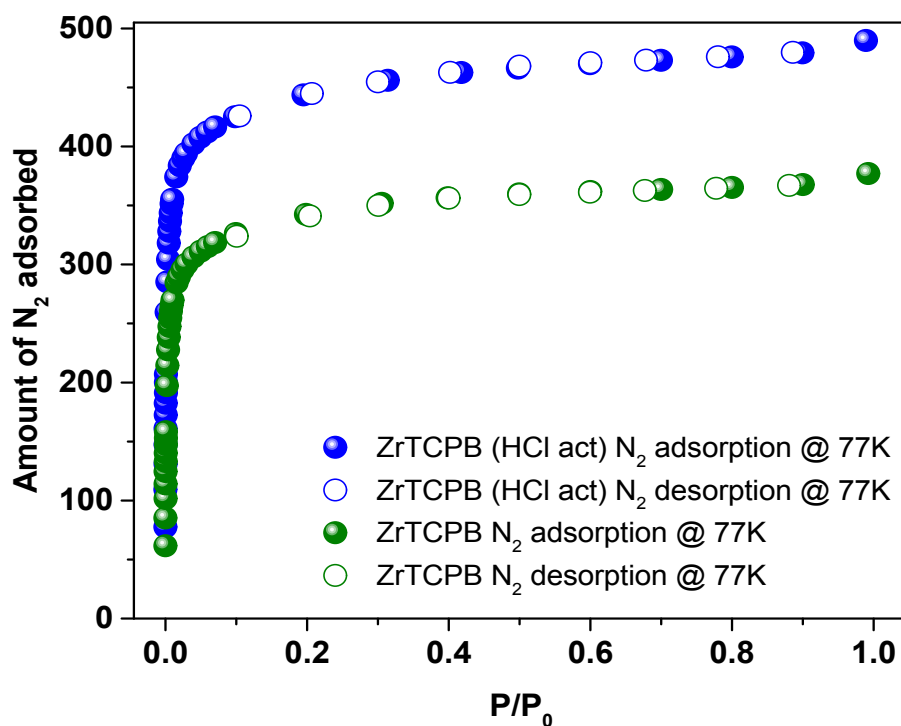

Figure S1. Nitrogen sorption isotherm measured at 77K on pristine (green) and HCl washed (blue) ZrTCPB sample.

Section S4: Powder X-ray Diffraction Studies

Measurements were performed on a Siemens Kristalloflex D500 diffractometer, CuK α radiation ($\lambda = 1.54178 \text{ \AA}$).

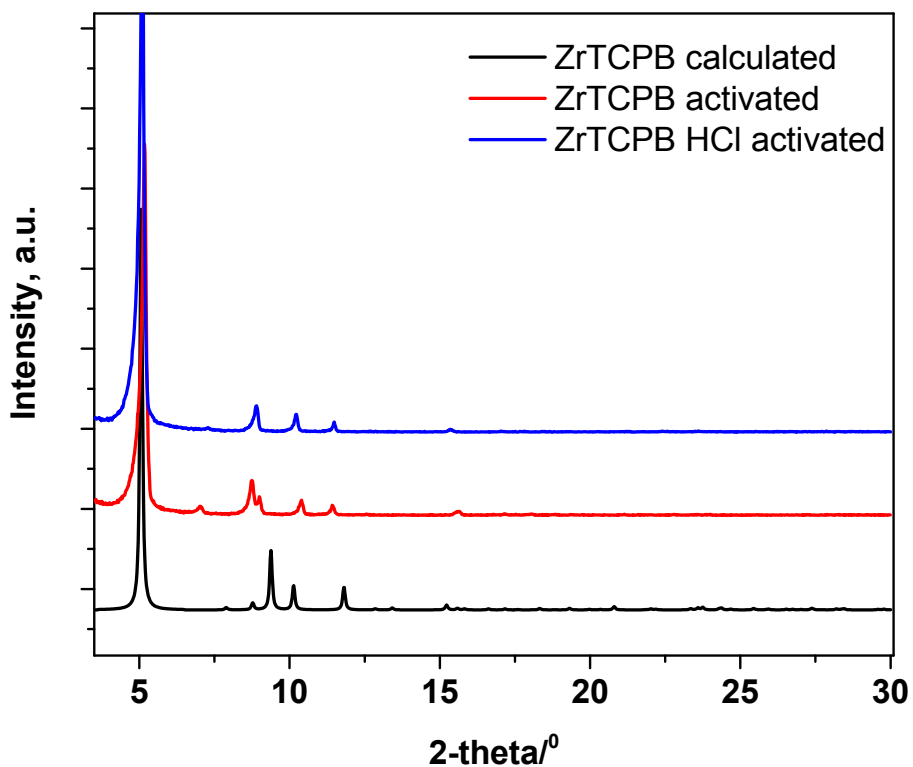

Figure S2. X-ray powder diffraction of pristine (red trace) and HCl washed (blue trace) ZrTCPB sample.

Unit cell	a (\AA)	b (\AA)	c (\AA)	Volume (\AA^3)
ZrTCPB (this work)	20.04(3)	34.80(3)	11.86(2)	8271.9

Section S5: ³¹P Nuclear Magnetic Resonance (NMR) Experiments

DMNP simulant

Dimethyl 4-nitrophenyl phosphate (DMNP) was used as received from Sigma-Aldrich with no further purification steps performed.

In a representative in situ NMR experiment, the ZrTCPB sample was added to 1 mL of solvent in an NMR tube. To improve the MOF dispersion into the solvent, the sample was vortexed for 30 s, followed by sonication for 1 min, and then vortexed again for 30 s. 4 μ L of simulant was added to the mixture, the tube was capped and shaken vigorously twice and then was immediately placed in the instrument, tuned, and the run started.

³¹P NMR experiments were performed on a Bruker Avance III 500 instrument using a 5 mm broadband probe, with a ³¹P observed frequency of 202.47 MHz. Experiments were performed in an unlock mode on all reaction mixtures at a stabilized temperature of 50 °C. The ³¹P NMR experiments were obtained with standard single pulse Bloch decay with inverse gated ¹H decoupling pulse sequence (Bruker program zgig) using a spectral width of 100 ppm, recycle delay of 30s, and 16 scan averages. Integration was performed in the Bruker Biospin TOPSPIN software suite and used a normalized total ³¹P signal for analysis. The ³¹P NMR chemical shifts were referenced to the external 85% H₃PO₄ standard $\delta = 0.0$ ppm.

Sarin (GB) and GD. ***Caution should be taken on any tests involving GB. The experiments should be run by trained personnel using appropriate safety procedures.***

The GB and GD ³¹P NMR experiments were performed on a Varian 400 instrument using a 5 mm broadband probe, with a ³¹P observed frequency of 161.85 MHz. Experiments were performed in a lock mode on all reaction mixtures at a stabilized temperature of 50°C. The ³¹P NMR experiments were obtained with standard single pulse decay with ¹H decoupling pulse sequence using a spectral width of 100 ppm, recycle delay of 3.75s, and 128 scan averages. The ZrTCPB sample (9.6 mg) was dispersed into a 5 mm NMR tube containing MeOH (1 mL), followed by the addition of GB and GD, respectively (4.5 μ L). The NMR tube was capped and shaken vigorously before being placed into the NMR magnet for monitoring by ³¹P NMR spectroscopy on a Varian INOVA 400 MHz NMR spectrometer. The temperature was maintained by a temperature controlled probe, and the ³¹P NMR chemical shifts were referenced to the external standard phosphoric acid $\delta = 0.0$ ppm. Integration was performed utilizing Varian vnmrj 2.3C software. The ³¹P NMR chemical shifts were referenced to the external 85% H₃PO₄ standard $\delta = 0.0$ ppm.

Section S6: Computational Details

The previously published crystal structure of ZrTCPB was used for DFT calculations.¹ An initial optimization of the crystal structure was performed in a three step process. First, the ion positions were optimized with fixed cell dimensions, followed by an optimization of ions and cell parameters, and then ended with an additional ion-only optimization. Initial positions for GB and GD were created by manually placing, with Materials Studio,² the molecules near the active site. A single solvent molecule was incorporated, which is initially placed between the OH chelated to a Zr and the μ_3 -OH. All calculations were performed using the projector augmented wave approach³ as implemented in the Vienna Ab Initio Simulation Package.⁴ The Perdew-Burker-Ernzerhof revised for solids (PBEsol) exchange correlation functional⁵ was used on a single Γ point in the Brillouin-zone. Van der Waals corrections were applied using the DFT-D3 method with Becke-Jonson damping.⁶ A 400 eV plane wave cutoff energy was used. Optimizations were continued until the force on all atoms was smaller than $0.03 \text{ eV} \cdot \text{\AA}^{-1}$. Vibrational calculations were performed on all optimized intermediates and transitions to confirm the existence of 0 (intermediates) or 1 (transition state) imaginary frequency. Transition states were located using the climbing image nudge elastic band method⁷. Initial structures were located along the relevant path via a linear interpolation between initial and final states.

Section S7: Additional Tables and Figures

ZrTCPB Ratio Study			
Ratio of MOF to DMNP	MOF (mg)	DMNP (mg)	MeOH (mg)
6.89%	2.9	5.6	779.2
7.79%	3.1	5.3	777.3
14.79%	5	4.5	781
16.82%	7.2	5.7	777.1
28.40%	9.6	4.5	773.1

Table S1. ZrTCPB to DMNP variable mol ratio study.

Solvent	pH	
	Initial	Final
H₂O	7.0	5.0
MeOH	6.5	6.0
IPA	6.5	6.5
HFE	6.5	6.5

Table S2. Initial and final pH of the solutions before and after MOF-based degradation of DMNP.

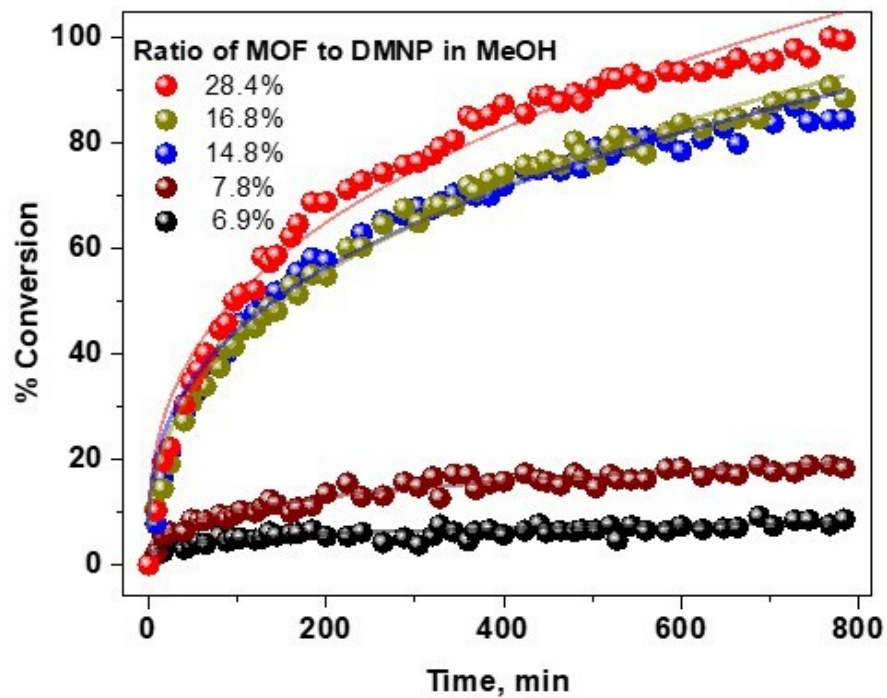

Figure S3. ZrTCPB-based degradation of DMNP in methanol as function of variable MOF:DMNP ratios.

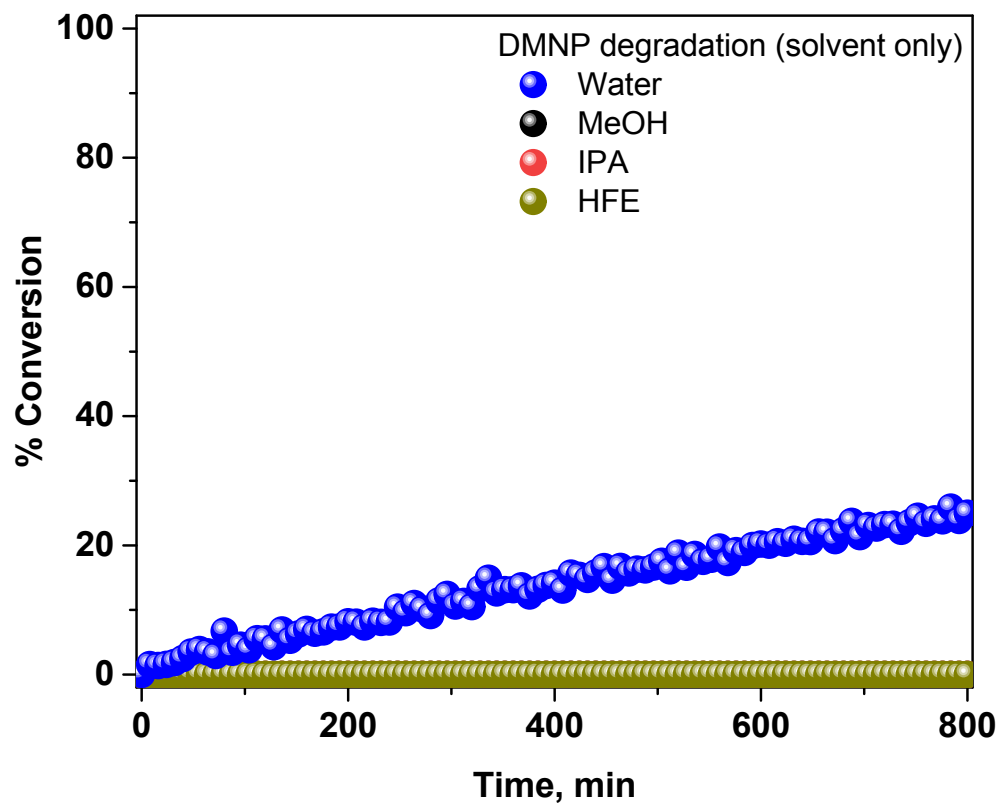

Figure S4. DMNP degradation in water, methanol, isopropyl alcohol and HFE.

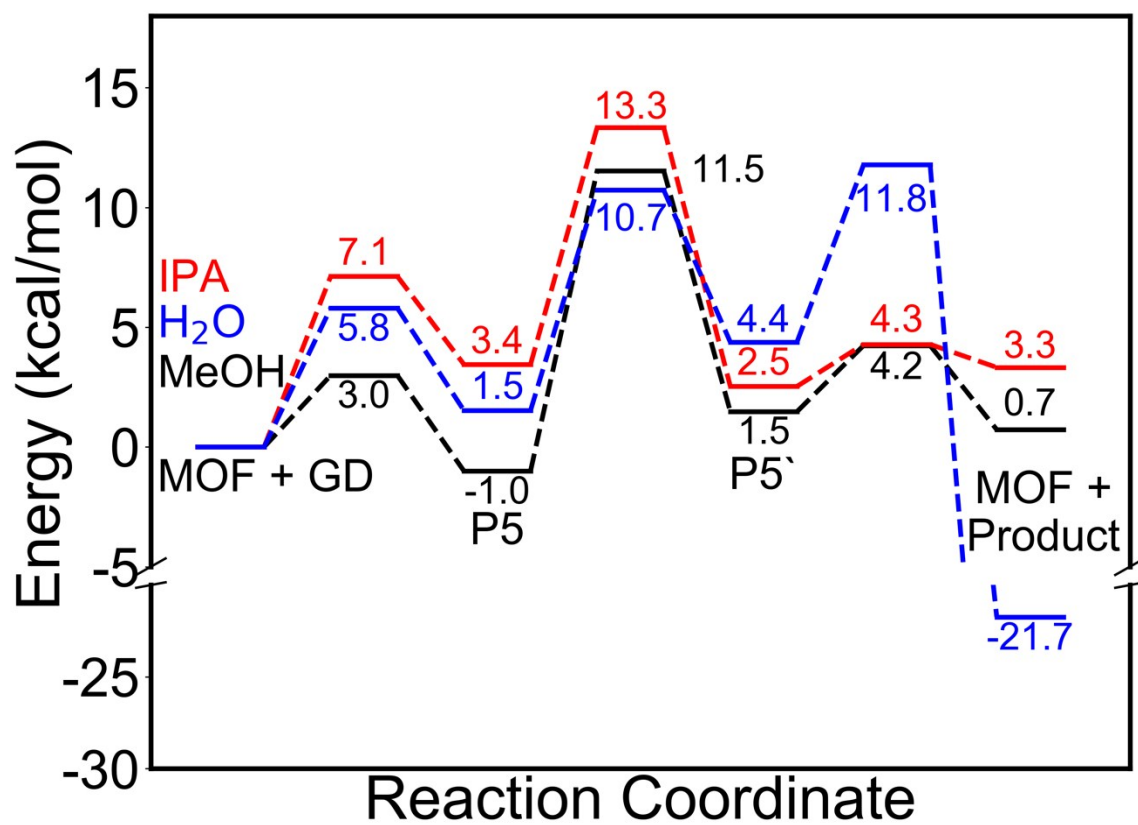

Figure S5. Reaction pathway energies for the degradation of GD on ZrTCPB in H₂O (blue), MeOH (black), and IPA (red). The energies shown for each transition state and intermediate are in kcal·mol⁻¹ units.

Figure S6. Structures of intermediates and transition states in the degradation pathway of GD with H₂O on ZrTCPB (H = white, O = red, Zr = teal, F = light blue, C = gray). Only the active site is depicted for visual clarity. Relevant distances are shown.

Figure S7. Structures of intermediates and transition states in the degradation pathway of GB with H₂O on ZrTCPB (H = white, O = red, Zr = teal, F = light blue, C = gray). Only the active site is depicted for visual clarity. Relevant distances are shown.

Figure S8. Structures of intermediates and transition states in the degradation pathway of GD with MeOH on ZrTCPB (H = white, O = red, Zr = teal, F = light blue, C = gray). Only the active site is depicted for visual clarity. Relevant distances are shown.

Figure S9. Structures of intermediates and transition states in the degradation pathway of GB with MeOH on ZrTCPB (H = white, O = red, Zr = teal, F = light blue, C = gray). Only the active site is depicted for visual clarity. Relevant distances are shown.

Figure S10. Structures of intermediates and transition states in the degradation pathway of GD with IPA on ZrTCPB (H = white, O = red, Zr = teal, F = light blue, C = gray). Only the active site is depicted for visual clarity. Relevant distances are shown.

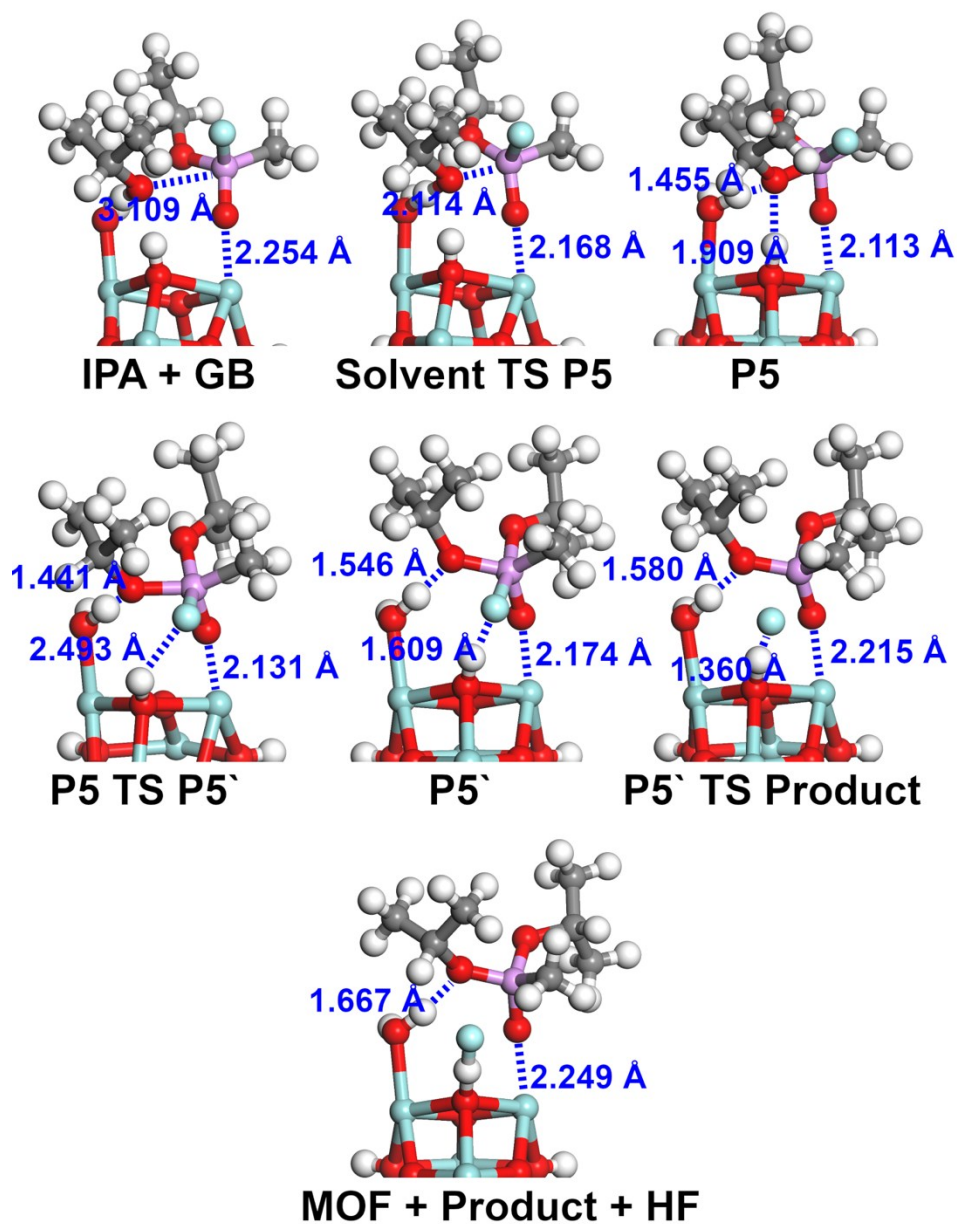

Figure S11. Structures of intermediates and transition states in the degradation pathway of GB with IPA on ZrTCPB (H = white, O = red, Zr = teal, F = light blue, C = gray).

Only the active site is depicted for visual clarity. Relevant distances are shown.

Figure S12. Structures of the initial (left) and final (right) states of GB degradation in H₂O (top) and MeOH (bottom). The dihedral angle of two relevant linkers near the active site is indicated. The angle changes more drastically from initial to final for the larger MeOH solvent.

Solvent	GB	GD
H ₂ O	10	14
MeOH	24	25
IPA	33	20

Table S3. Change in the dihedral angle (°) of the linker depicted in Fig. S12 from initial to final state for GB and GD in H₂O, MeOH, and IPA.

Figure S13. Stable structures of GB degraded on ZrTCPB by H₂O. The relative energies of each are (a) 0.0, (b) 4.9, and (c) 28.4 kcal · mol⁻¹. Only the degraded structure depicted in (c) remains protonated.
