## List of Tables and Figures:

**Table S1.** The sequences of model Mim-containing peptides and the results of HPLC and ESI-MS analysis.

**Figure S1.** DFT 1:3 complexes characterized with Fe(III): Fe.(DFP)3 and Fe.(DFPunmet)3 (above), Fe.(MIM)3 and Fe.(MIMmet)3 (below).

**Figure S2.** DFT 1:2 complexes characterized with Fe(III): Fe.(DFP)<sub>2</sub> and Fe.(DFPunmet)<sub>2</sub> (above), Fe.(MIM)3 and Fe.(MIMmet)3 (below).

**Figure S3.** DFT 1:1 complexes characterized with Fe(III): Fe.(DFP) and Fe.(DFPunmet) (above), Fe.(MIM)3 and Fe.(MIMmet)3 (below).

**Figure S4.** DFT 1:2 complexes characterized with Cu(II): Cu.(DFP)<sub>2</sub> and Cu.(DFPunmet)<sub>2</sub> (above), Cu.(MIM)2 and Cu.(MIMmet)2 (below).

**Figure S5.** DFT 1:1 complexes characterized with Cu(II): Cu.(DFP) and Cu.(DFPunmet) (above), Cu.(MIM) and Cu.(MIMmet) (below).

**Figure S6.** Speciation plots of DFP and MIM with iron ions (up; [DFP]= $1.0 \times 10^{-3}$  [M]; [Fe<sup>3+</sup>]= $3.3 \times 10^{-4}$  [M] and [MIM]= $1.0 \times 10^{-3}$  [M]) and with copper ions (down; [DFP]= $1.00 \times 10^{-3}$  [M]; [Cu<sup>2+</sup>]= $5 \times 10^{-4}$  [M] and [MIM]= $1 \times 10^{-3}$  [M]). Metal complexes calculated on the basis of stability constants reported in Ref. 25 (DFP with Fe<sup>3+</sup> and Cu<sup>2+</sup>), 32 (MIM with Fe<sup>3+</sup>) and 31 (MIM complexes with Cu<sup>2+</sup>). Charges are omitted for simplicity.

**Table S2.** Computed binding enthalpies ( $\Delta H_{\text{comp}}$ ) and free energies ( $\Delta G_{\text{comp}}$ ) in solution of 1:1, 1:2 and 1:3 Fe(III):Ligand complexes and 1:1, 1:2 Cu(II):Ligand complexes, where Ligand can be: DFP, DFPunmet, MIM, MIMmet (see Scheme 2). Geometries are shown in Fig. S1 and S2. All energies are in kcal/mol and for each stoichiometry the relative free energy values were also calculated ( $\Delta \Delta G_{\text{comp}}$ ) taking M.(DFP)n as reference. Available experimental log $\beta$  values are also included. <sup>a</sup>Data taken from ref.25. <sup>b</sup>Data taken from ref.32. <sup>c</sup>Data taken from ref.31.

**Table S3.** <sup>1</sup>H and <sup>13</sup>C chemical shifts assigned for the Peptide1 H-Mim-Val-Tyr-Thr-NH2 [ppm].

**Table S4.** <sup>1</sup>H and <sup>13</sup>C chemica shifts assigned for the Peptide2 H-Asp-Mim-Tyr-Thr-NH2 [ppm].

**Table S5.** <sup>1</sup>H and <sup>13</sup>C chemical shifts assigned for the Peptide3 H-Asp-Val-Mim-Thr-NH2 [ppm].

**Table S6.** <sup>1</sup>H and <sup>13</sup>C chemical shifts assigned for the Peptide4 H-Mim-Gly-Mim-Gly-OH [ppm].

**Table S7.** 1H and 13C chemical shifts assigned for the Peptide5 H-Mim-Gly-Pro-Gly-Mim-Gly-OH [ppm].

**Table S8.** 1:3 Fe(III)-DFP crystallographic data compared with DFT optimized geometries of metal coordination core. Optimizations carried out at the B3LYP-D3(BJ)/6-31++(g,d) IEFPCM level of theory. A, B and C distinguish different MIM amino acids, while p (para) and m (meta) is the oxygen (carbonyl and hydroxyl) position respect to the nitrogen in the pyridinone ring.

**Table S9.** 1:2 Cu(II)-DFP crystallographic data compared with DFT optimized geometries of metal coordination core. Optimizations carried out at the B3LYP-D3(BJ)/6-31++(g,d) IEFPCM level of theory. A, B and C distinguish different MIM amino acids, while p (para) and m (meta) is the oxygen (carbonyl and hydroxyl) position respect to the nitrogen in the pyridinone ring.

**Table S10.** 1:2 Cu(II)-DFP crystallographic data compared with 2:2 Cu(II)-MIM and 2:2 Cu(II)-P2 DFT optimized geometries of metal coordination core. Optimizations carried out at the B3LYP-D3(BJ)/6-31++(g,d) IEFPCM level of theory. A and B distinguish ligand binding sites in different ligands, while p (para) and m (meta) is the oxygen (carbonyl and hydroxyl) position respect to the nitrogen in the pyridinone ring.

**Table S11.** 1:1 Fe(III)-peptide DFT optimized geometries data of metal coordination core. Optimizations carried out at the B3LYP-D3(BJ)/6-31++(g,d) IEFPCM level of theory. A, B and C distinguish different MIM amino acids in the peptide, while p (para) and m (meta) is the oxygen (carbonyl and hydroxyl) position respect to the nitrogen in the pyridinone ring. W refers to water molecule.

**Table S12.** 1:1 Cu(II)-peptide DFT optimized geometries data of metal coordination core. Optimizations carried out at the B3LYP-D3(BJ)/6-31++(g,d) IEFPCM level of theory. A and B distinguish different MIM amino acids in the peptide, while p (para) and m (meta) is the oxygen (carbonyl or hydroxyl) position respect to the nitrogen in the pyridinone ring. W refers to water molecule.

**Table S13.** 2:2 Cu(II)-peptide DFT optimized geometries data of metal coordination core. Optimizations carried out at the B3LYP-D3(BJ)/6-31++(g,d) IEFPCM level of theory. A1 and B1 distinguish different MIM amino acids in the first peptide in the dimer complex and A2 and B2 distinguish MIM amino acids in the second peptide in the dimer complex, while p (para) and m (meta) is the oxygen (carbonyl or hydroxyl) position respect to the nitrogen in the pyridinone ring.

**Table S14.** Antimicrobial screening of mimosine derived peptides evaluated using by the agar plate disk diffusion method.

**Table S15.** Minimum inhibitory concentration (MIC) and minimum bactericidal concentration (MBC) of the mimosine-peptides ( $\mu\text{g}/\text{mL}$ ).

**Table S16.** Minimum inhibitory concentration (MIC) and minimum bactericidal concentration (MBC) of the mimosine-peptides iron complexes ( $\mu\text{g}/\text{mL}$ ).

**Table S17.** MIC activity of Peptide 6 with and without iron.

**Table S18.** Biofilm inhibition activity of Peptide 6 with and without iron.

**Figure S7.** Graphical representation of biofilm inhibition activity of Peptide 6 with and without iron (Table S16).

**Figure S8.** Computed binding energies in solution ( $\Delta G_{\text{comp}}$ , in kcal/mol) versus experimental stability constants ( $\log\beta$ ) of 1:1, 1:2 and 1:3 Fe(III):Ligand complexes and 1:1 1:2 Cu(II):Ligand complexes, where Ligand can be either DFP or MIM. The correlation coefficient ( $r$ ) is 0.9873.

**Figure S9.** ESI-MS spectrum of peptide 1 complex with Fe(III) ions.

**Figure S9a.** Enlarged fragment of the ESI-MS spectrum of  $[\text{Fe}(\text{P1H-1})]^+$  complex. Inlet presents the generated isotopic distribution for the  $\text{C}_{26}\text{H}_{34}\text{FeN}_6\text{O}_8$  ion.

**Figure S10.** ESI-MS spectrum of peptide 1 complex with Cu(II) ions.

**Figure S10a.** ESI-MS spectrum of  $[\text{Cu}(\text{P1H-1})]^+$  complex. Inlet presents the generated isotopic distribution for the  $\text{C}_{26}\text{H}_{34}\text{CuN}_6\text{O}_8$  ion.

**Figure S11.** TDDFT spectra of Fe(DFP), using the WB97XD functional [D. Chai and M. Head-Gordon, “Long-range corrected hybrid density functionals with damped atom-atom dispersion corrections,” *Phys. Chem. Chem. Phys.*, 10 (2008) 6615-20. DOI: 10.1039/B810189B] and the SMD implicit solvation model [A. V. Marenich, C. J. Cramer, and D. G. Truhlar, “Universal solvation model based on solute electron density and a continuum model of the solvent defined by the bulk dielectric constant and atomic surface tensions,” *J. Phys. Chem. B*, 113 (2009) 6378-96. DOI: 10.1021/jp810292n] with the addition of explicit second-shell water molecules.

**Figure S12.** TDDFT spectra of  $\text{Fe}(\text{DFP})_2$ , using the WB97XD functional [D. Chai and M. Head-Gordon, “Long-range corrected hybrid density functionals with damped atom-atom dispersion corrections,” *Phys. Chem. Chem. Phys.*, 10 (2008) 6615-20. DOI: 10.1039/B810189B] and the SMD implicit solvation model [A. V. Marenich, C. J. Cramer, and D. G. Truhlar, “Universal solvation model based on solute electron density and a continuum model of the solvent defined by

the bulk dielectric constant and atomic surface tensions," J. Phys. Chem. B, 113 (2009) 6378-96. DOI: 10.1021/jp810292n].

**Figure S13.** TDDFT spectra of  $\text{Fe}(\text{DFP})_3$ , using the WB97XD functional [D. Chai and M. Head-Gordon, "Long-range corrected hybrid density functionals with damped atom-atom dispersion corrections," Phys. Chem. Chem. Phys., 10 (2008) 6615-20. DOI: 10.1039/B810189B] and the SMD implicit solvation model [A. V. Marenich, C. J. Cramer, and D. G. Truhlar, "Universal solvation model based on solute electron density and a continuum model of the solvent defined by the bulk dielectric constant and atomic surface tensions," J. Phys. Chem. B, 113 (2009) 6378-96. DOI: 10.1021/jp810292n].

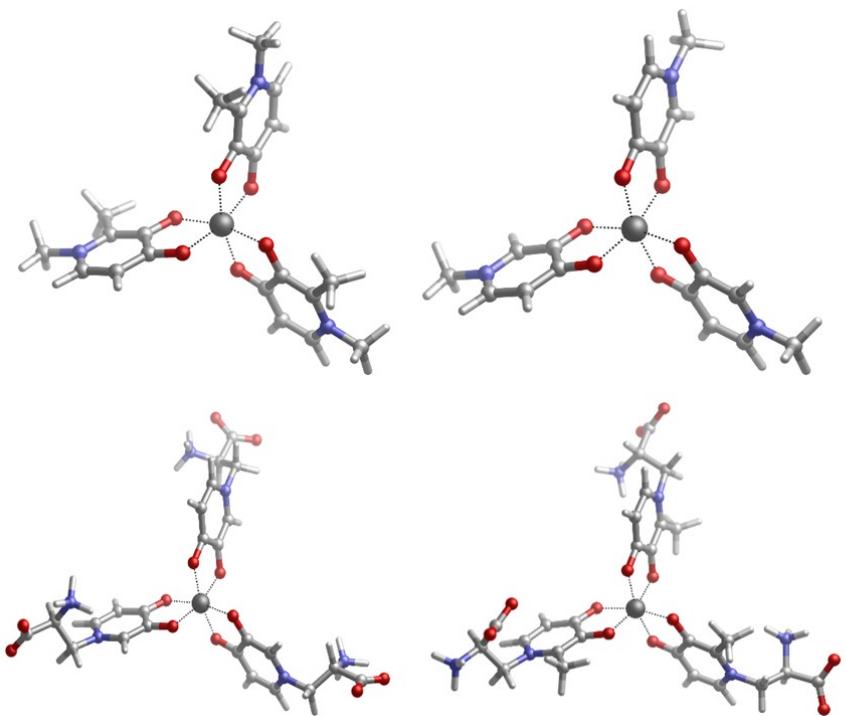

**Figure S14.** TDDFT spectra using the WB97XD/6-31G(d) functional [D. Chai and M. Head-Gordon, "Long-range corrected hybrid density functionals with damped atom-atom dispersion corrections," Phys. Chem. Chem. Phys., 10 (2008) 6615-20. DOI: 10.1039/B810189B] and the SMD implicit solvation model [A. V. Marenich, C. J. Cramer, and D. G. Truhlar, "Universal solvation model based on solute electron density and a continuum model of the solvent defined by the bulk dielectric constant and atomic surface tensions," J. Phys. Chem. B, 113 (2009) 6378-96. DOI: 10.1021/jp810292n], for the different peptides (peptides 1 to 6) bound to Fe(III), compared to the experimental and theoretical data for  $\text{Fe}(\text{DFP})$ ,  $\text{Fe}(\text{DFP})_2$  and  $\text{Fe}(\text{DFP})_3$

**Figure S15.** TDDFT spectra using the WB97XD/6-311G(d,p) functional [D. Chai and M. Head-Gordon, "Long-range corrected hybrid density functionals with damped atom-atom dispersion corrections," Phys. Chem. Chem. Phys., 10 (2008) 6615-20. DOI: 10.1039/B810189B] and the SMD implicit solvation model [A. V. Marenich, C. J. Cramer, and D. G. Truhlar, "Universal solvation model based on solute electron density and a continuum model of the solvent defined by the bulk dielectric constant and atomic surface tensions," J. Phys. Chem. B, 113 (2009) 6378-96. DOI: 10.1021/jp810292n], for the different peptides (peptides 1 to 6) bound to Fe(III), compared to the experimental and theoretical data for  $\text{Fe}(\text{DFP})$ ,  $\text{Fe}(\text{DFP})_2$  and  $\text{Fe}(\text{DFP})_3$

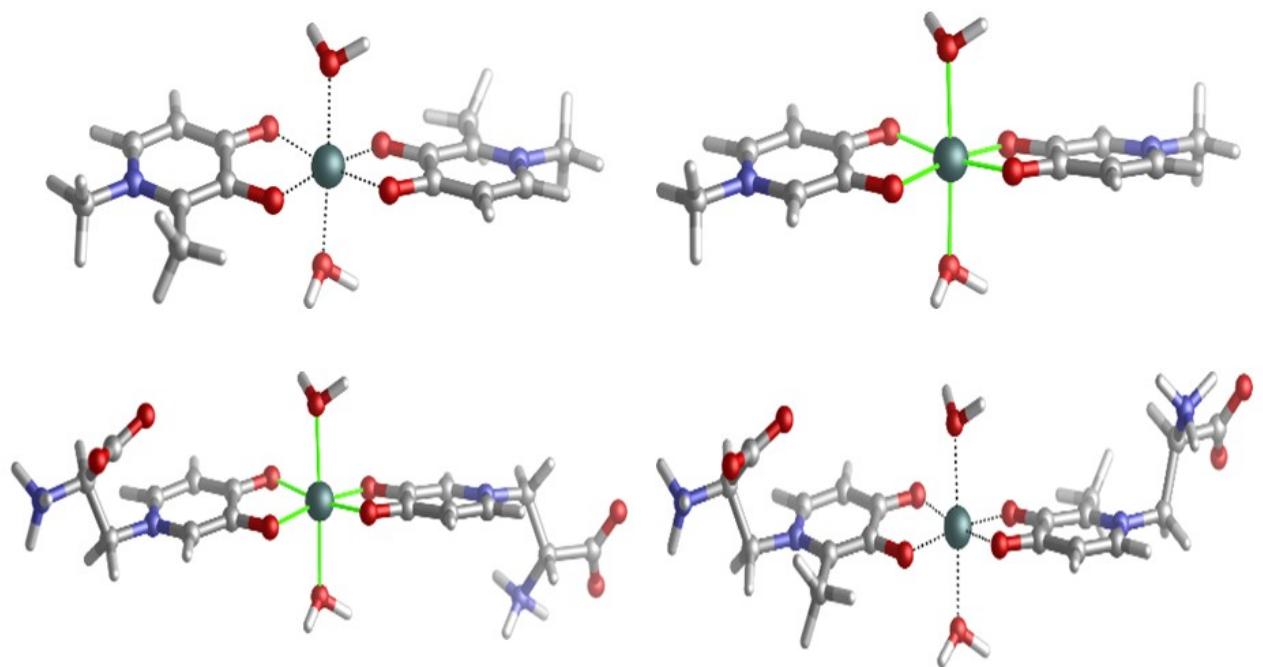

**Table S1.** The sequences of model Mim-containing peptides and the results of HPLC and ESI-MS analysis.

Peptide number	Peptide sequence	Retention time [min]	[M+H] <sup>+</sup> found <i>m/z</i> <sup>a</sup>	[M+H] <sup>+</sup> calculated for formula (monoisotopic) <i>m/z</i> <sup>a</sup>
1	H-Mim-Val-Tyr-Thr-NH <sub>2</sub>	6.5	561.264	561.267
2	H-Asp-Mim-Tyr-Thr-NH <sub>2</sub>	5.6	577.227	577.225
3	H-Asp-Val-Mim-Thr-NH <sub>2</sub>	5.2	513.231	513.230
4	H-Mim-Gly-Mim-Gly-OH	4.9	492.189	492.184
5	H-Mim-Gly-Pro-Gly-Mim-Gly-OH	6.5	647.246	647.242
6	H-Mim-Gly-Pro-Gly-Mim-Gly-Gly-Mim-OH	6.2	884.319	884.317

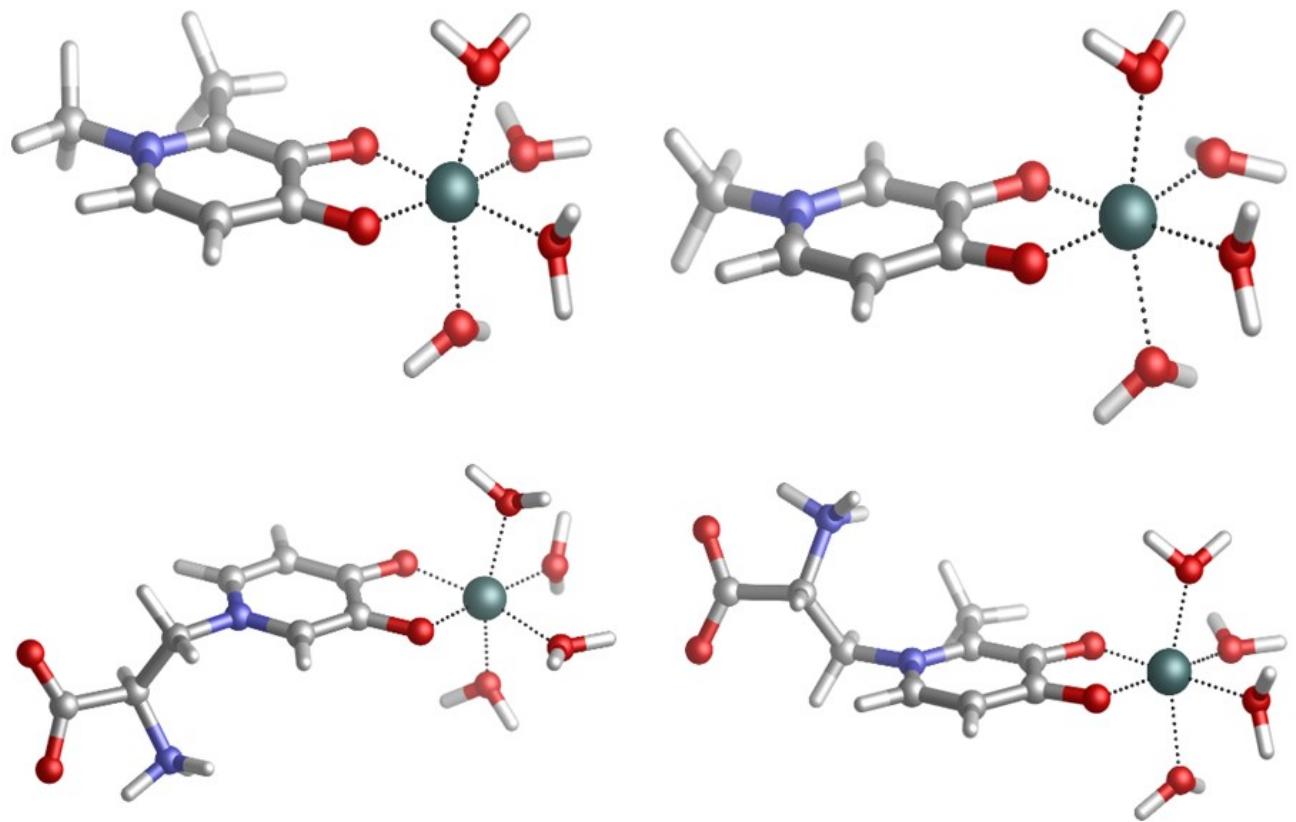

<sup>a</sup> *m/z* values are presented for the monoisotopic ions

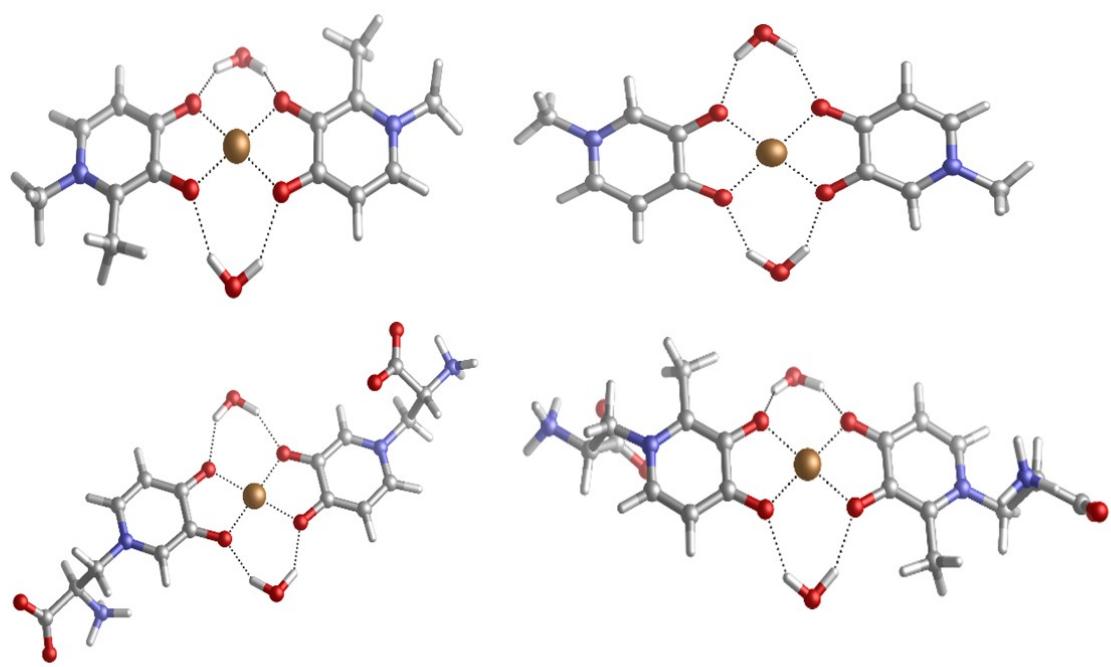

**Figure S1.** DFT 1:3 complexes characterized with Fe(III): Fe.(DFP)<sub>3</sub> and Fe.(DFPunmet)<sub>3</sub> (above), Fe.(MIM)<sub>3</sub> and Fe.(MIMmet)<sub>3</sub> (below).

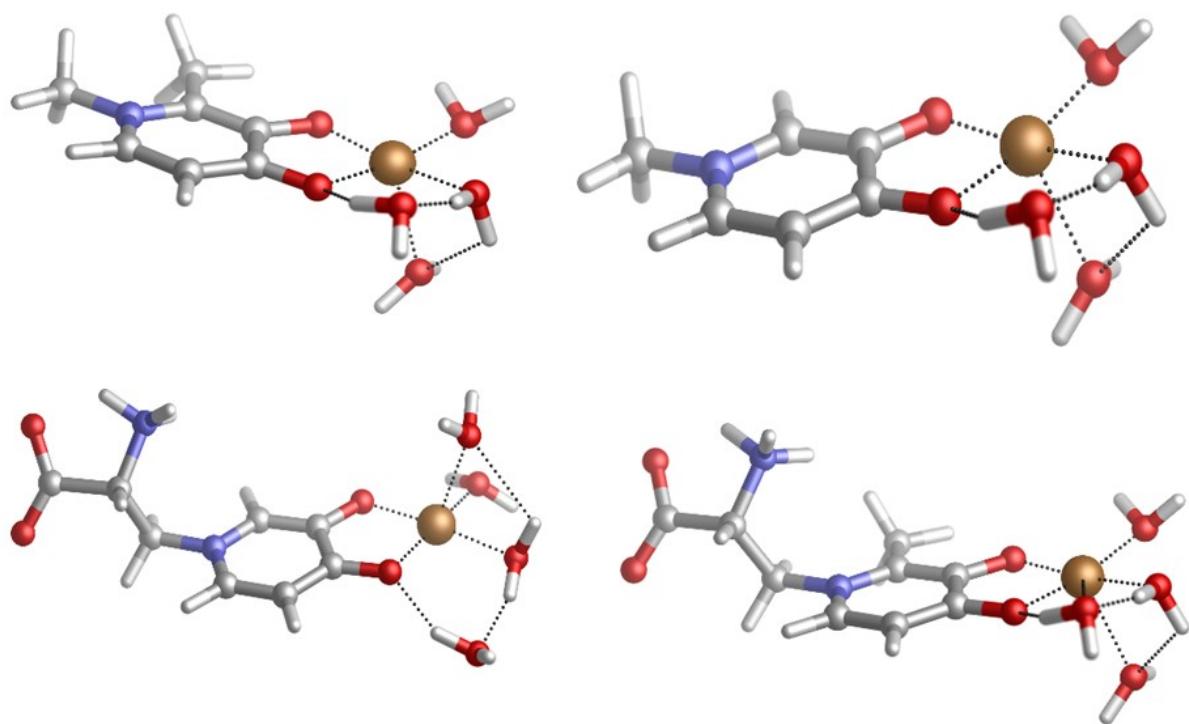

**Figure S2.** DFT 1:2 complexes characterized with Fe(III): Fe.(DFP)<sub>2</sub> and Fe.(DFP<sup>+</sup>unmet)<sub>2</sub> (above), Fe.(MIM)<sub>3</sub> and Fe.(MIM<sup>+</sup>met)<sub>3</sub> (below).

**Figure S3.** DFT 1:1 complexes characterized with  $\text{Fe(III)}$ :  $\text{Fe.(DFP)}$  and  $\text{Fe.(DFPunmet)}$  (above),  $\text{Fe.(MIM)}$  and  $\text{Fe.(MIMmet)}$  (below).

**Figure S4.** DFT 1:2 complexes characterized with Cu(II): Cu.(DFP)<sub>2</sub> and Cu.(DFPunmet)<sub>2</sub> (above), Cu.(MIM)<sub>2</sub> and Cu.(MIMmet)<sub>2</sub> (below).

**Figure S5.** DFT 1:1 complexes characterized with Cu(II): Cu.(DFP) and Cu.(DFPunmet) (above), Cu.(MIM) and Cu.(MIMmet) (below).

**Table S2.** Computed binding enthalpies ( $\Delta H_{\text{comp}}$ ) and free energies ( $\Delta G_{\text{comp}}$ ) in solution of 1:1, 1:2 and 1:3 Fe(III):Ligand complexes and 1:1, 1:2 Cu(II):Ligand complexes, where Ligand can be: DFP, DF<sup>unmet</sup>, MIM, MIM<sup>met</sup> (see Scheme 2). Geometries are shown in Fig. S1 and S2. All energies are in kcal/mol and for each stoichiometry the relative free energy values were also calculated ( $\Delta \Delta G_{\text{comp}}$ ) taking M.(DFP)<sub>n</sub> as reference. Available experimental log $\beta$  values are also included. <sup>a</sup>Data taken from ref.25. <sup>b</sup>Data taken from ref.32. <sup>c</sup>Data taken from ref.31.

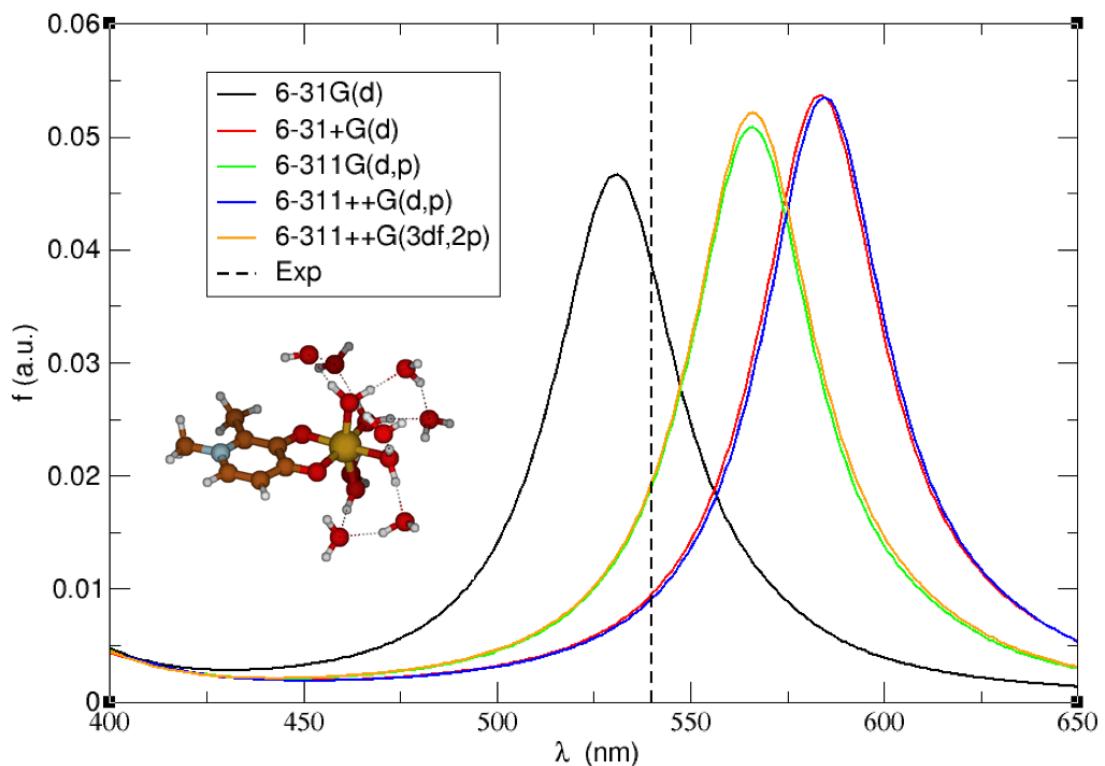

**Figure S9b.** Enlarged fragment of the ESI-MS spectrum of  $[Fe(P1)_2]^+$  complex. Inlet presents the generated isotopic distribution for the  $C_{52}H_{70}FeN_{12}O_{16}$  ion.

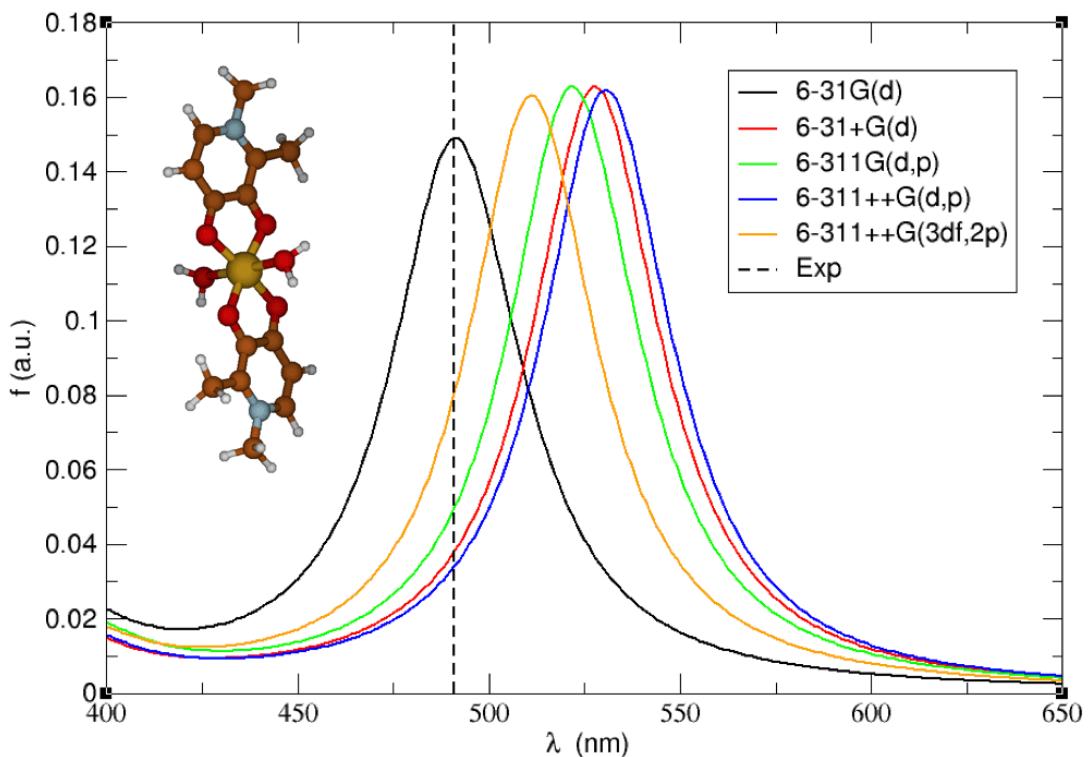

**Figure S10.** ESI-MS spectrum of peptide 1 complex with Cu(II) ions.

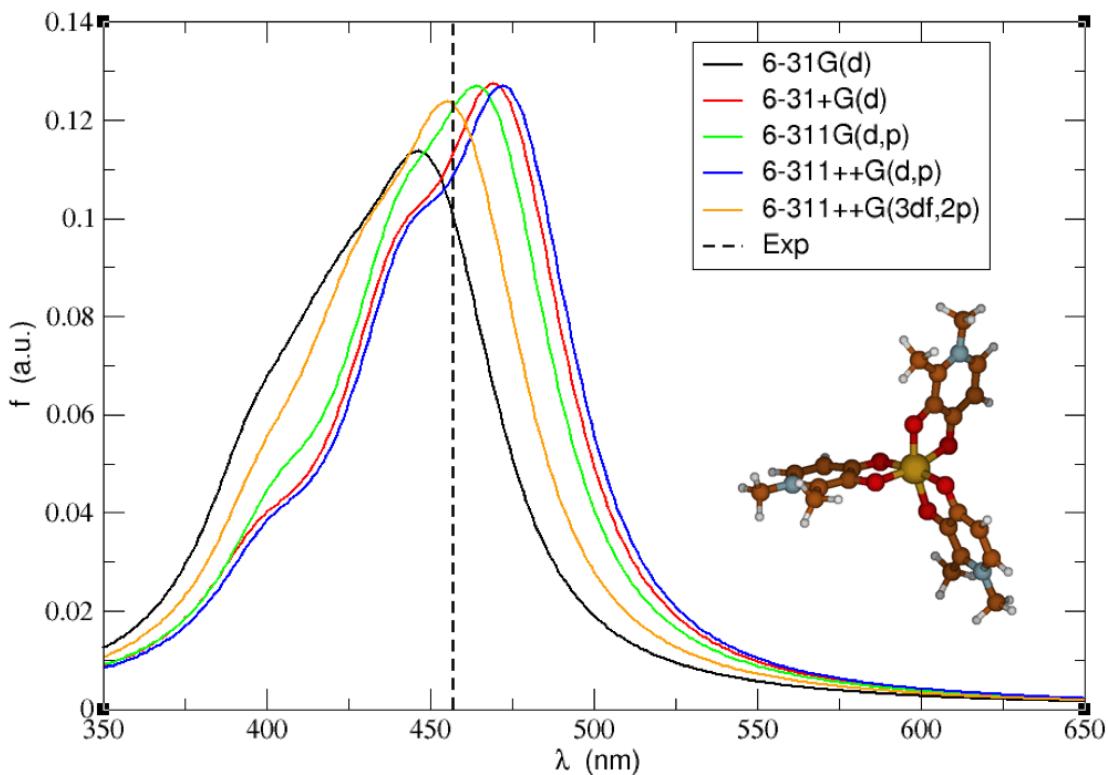

**Figure S10a.** ESI-MS spectrum of  $[\text{Cu}(\text{P1})\text{H}-1]^+$  complex. Inlet presents the generated isotopic distribution for the  $\text{C}_{26}\text{H}_{34}\text{CuN}_6\text{O}_8$  ion.

**Figure S11.** TDDFT spectra of Fe(DFP), using the WB97XD functional [D. Chai and M. Head-Gordon, “Long-range corrected hybrid density functionals with damped atom-atom dispersion corrections,” Phys. Chem. Chem. Phys., 10 (2008) 6615-20. DOI: 10.1039/B810189B] and the SMD implicit solvation model [A. V. Marenich, C. J. Cramer, and D. G. Truhlar, “Universal solvation model based on solute electron density and a continuum model of the solvent defined by the bulk dielectric constant and atomic surface tensions,” J. Phys. Chem. B, 113 (2009) 6378-96. DOI: 10.1021/jp810292n] with the addition of explicit second-shell water molecules.

**Figure S12.** TDDFT spectra of  $\text{Fe}(\text{DFP})_2$ , using the WB97XD functional [D. Chai and M. Head-Gordon, “Long-range corrected hybrid density functionals with damped atom-atom dispersion corrections,” Phys. Chem. Chem. Phys., 10 (2008) 6615-20. DOI: 10.1039/B810189B] and the SMD implicit solvation model [A. V. Marenich, C. J. Cramer, and D. G. Truhlar, “Universal solvation model based on solute electron density and a continuum model of the solvent defined by the bulk dielectric constant and atomic surface tensions,” J. Phys. Chem. B, 113 (2009) 6378-96. DOI: 10.1021/jp810292n].

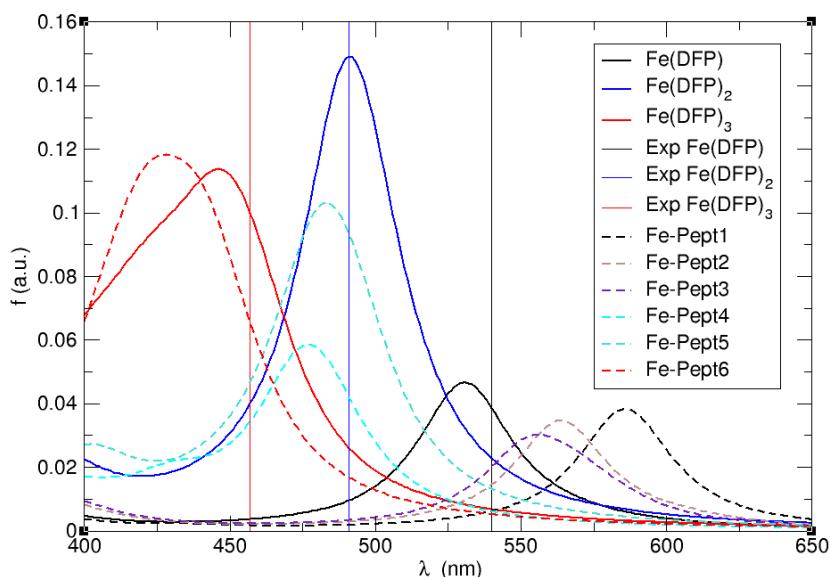

**Figure S13.** TDDFT spectra of  $\text{Fe}(\text{DFP})_3$ , using the WB97XD functional [D. Chai and M. Head-Gordon, “Long-range corrected hybrid density functionals with damped atom-atom dispersion corrections,” *Phys. Chem. Chem. Phys.*, 10 (2008) 6615-20. DOI: 10.1039/B810189B] and the SMD implicit solvation model [A. V. Marenich, C. J. Cramer, and D. G. Truhlar, “Universal solvation model based on solute electron density and a continuum model of the solvent defined by the bulk dielectric constant and atomic surface tensions,” *J. Phys. Chem. B*, 113 (2009) 6378-96. DOI: 10.1021/jp810292n].

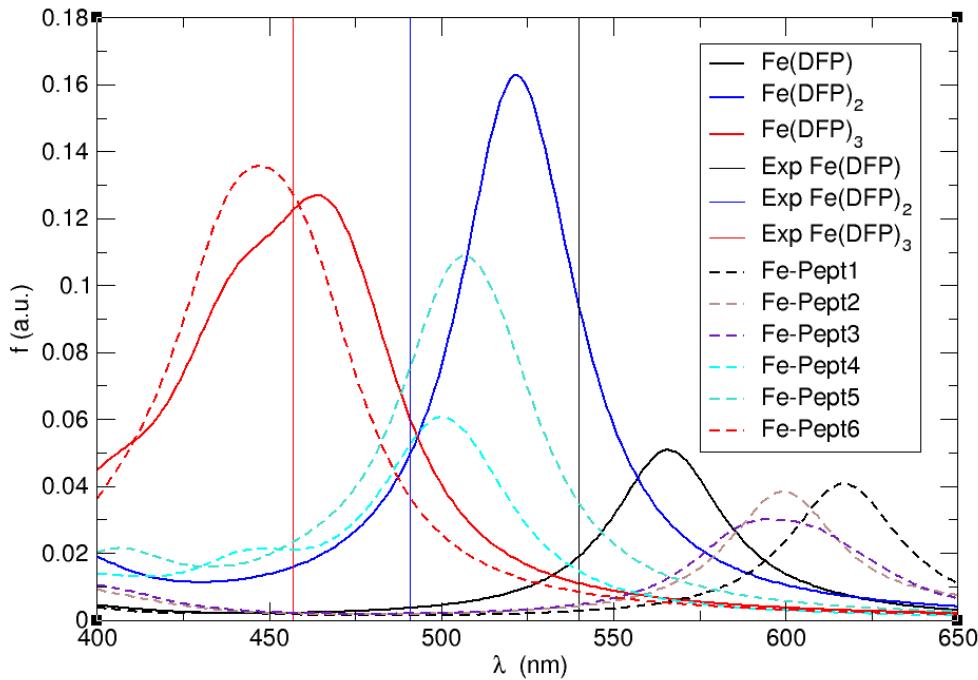

In Figures S11 to S13, we can see the calculated TDDFT spectra for  $\text{Fe}(\text{DFP})$ ,  $\text{Fe}(\text{DFP})_2$  and  $\text{Fe}(\text{DFP})_3$ . We have chosen a long-range corrected functional such as WB97XD for these calculations using different basis sets. For  $\text{Fe}(\text{DFP})$ , we included a second shell of explicit waters to avoid spurious effects on the calculated spectra. Quite interestingly, the smallest of the basis sets used in this work, namely, 6-31G(d) provided the best agreement with the experiments, the inclusion of diffuse functions shifted the spectra to longer wavelengths, with a partial recover of the agreement with the experiments with the largest basis set, namely 6-311++G(3df,2p). In general, irrespective of the basis set, we observe the same behavior as in the experimental spectra:  $\text{Fe}(\text{DFP})$  shows the lowest-energy absorption (higher wavelengths), followed by  $\text{Fe}(\text{DFP})_2$  and then  $\text{Fe}(\text{DFP})_3$ .

Next, we calculated the spectra for Peptides 1 to 6 bound to Fe(III), using the 6-31G(d) and 6-311G(d,p) basis sets. Both basis sets gave the same qualitative results, depicted in Figures S4 and S5. Thus, Pept 1 to 3 show the absorption at the lowest energies (highest wavelengths) as  $\text{Fe}(\text{DFP})$ , in

correspondence with the situation found for Fe(DFP). On the other hand, Fe-Pept4 and Fe-Pept5 show absorption at intermediate regions, overlapping the absorption region of Fe(DFP)<sub>2</sub>. Finally, Fe-Pept6 shows an absorption spectra similar to the one of Fe(DFP)<sub>3</sub>, that is, at the lowest wavelengths (i.e., highest energies), in agreement with experiments, and suggesting a binding pattern to three mimosine sidechains similar to the coordination mode of Fe(DFP)<sub>3</sub>.

**Figure S14.** TDDFT spectra using the WB97XD/6-31G(d) functional [D. Chai and M. Head-Gordon, “Long-range corrected hybrid density functionals with damped atom-atom dispersion corrections,” Phys. Chem. Chem. Phys., 10 (2008) 6615-20. DOI: 10.1039/B810189B] and the SMD implicit solvation model [A. V. Marenich, C. J. Cramer, and D. G. Truhlar, “Universal solvation model based on solute electron density and a continuum model of the solvent defined by the bulk dielectric constant and atomic surface tensions,” J. Phys. Chem. B, 113 (2009) 6378-96. DOI: 10.1021/jp810292n], for the different peptides (peptides 1 to 6) bound to Fe(III), compared to the experimental and theoretical data for Fe(DFP), Fe(DFP)<sub>2</sub> and Fe(DFP)<sub>3</sub>

**Figure S15.** TDDFT spectra using the WB97XD/6-311G(d,p) functional[D. Chai and M. Head-Gordon, “Long-range corrected hybrid density functionals with damped atom-atom dispersion corrections,” Phys. Chem. Chem. Phys., 10 (2008) 6615-20. DOI: 10.1039/B810189B] and the SMD implicit solvation model [A. V. Marenich, C. J. Cramer, and D. G. Truhlar, “Universal solvation model based on solute electron density and a continuum model of the solvent defined by the bulk dielectric constant and atomic surface tensions,” J. Phys. Chem. B, 113 (2009) 6378-96. DOI: 10.1021/jp810292n], for the different peptides (peptides 1 to 6) bound to Fe(III), compared to the experimental and theoretical data for Fe(DFP), Fe(DFP)<sub>2</sub> and Fe(DFP)<sub>3</sub>
