Figures

**Fig. S1** X-ray diffractograms of core-shell, DEX, and DEX(SO₄) coated and bare ZnO NPs. Note additional crystal phases present in DEX and DEX(SO₄), likely from crystallized dextran.

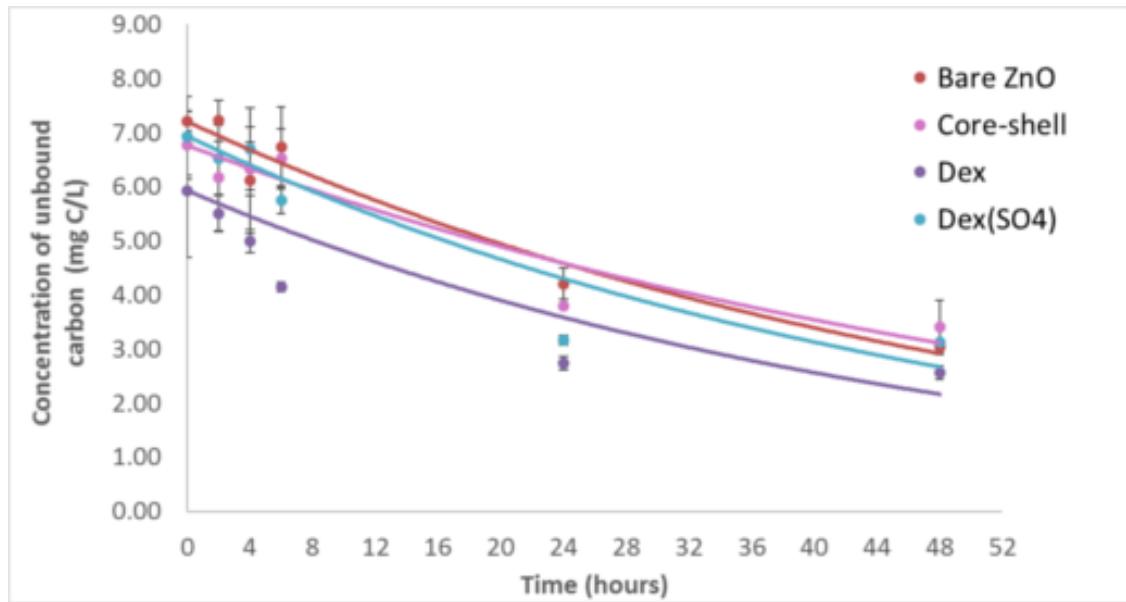

Fig. S2 Equilibrium time reached after 24 h incubation period in batch sorption isotherms experiments, each point is the average of three independent replicates. Error bars represent \pm one standard deviation.

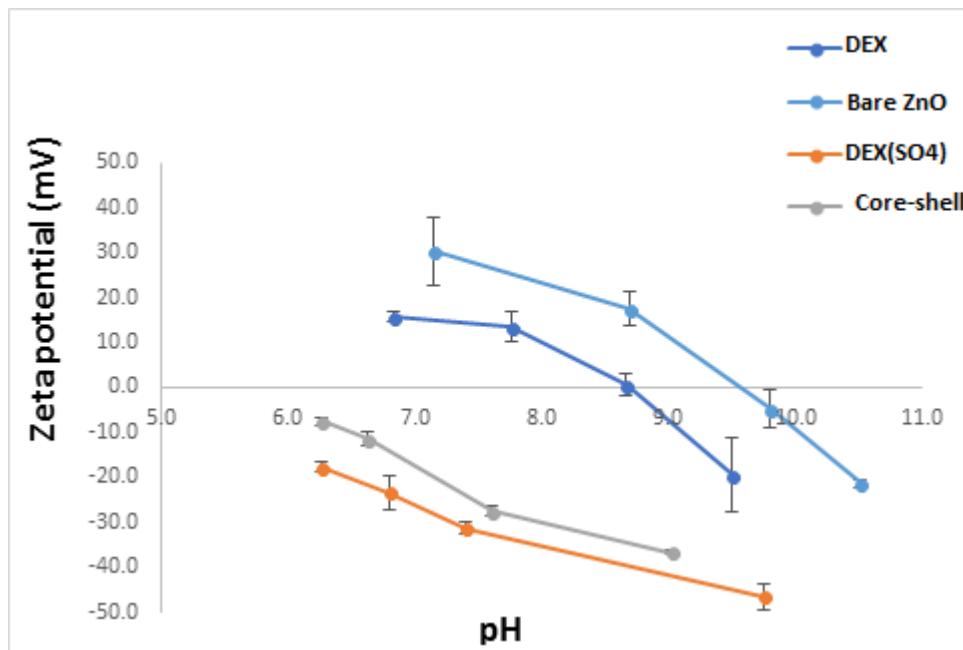

Fig. S3 Electrophoretic mobility of bare ZnO, dextran coated, (DEX-ZnO), ZnO-Zn₃(PO₄)₂ (core-shell), and dextran sulfate coated (DEX(SO₄)-ZnO NPs as a function of pH in deionized (DI) water. Zn concentration was 100 mg L⁻¹ for all the tested suspensions.
