TEXT

Text S1. Determination of concentration of IDM

The concentration of IDM was analyzed via Shimadzu LC 20A high performance liquid chromatography (HPLC, Japan) equipped with a C18 reversed-phase column (Zorbax Eclipse, 4.6 × 250 mm, 5 μm). The isocratic elution consisted of 70 % methanol and 30 % water containing 0.2 % (v/v) formic acid, with a flow rate of 1 mL·min⁻¹. The detection wavelength was set at 270 nm.

Text S2. Intermediates Identification by HRAM LC-MS/MS

The photocatalytic degradation intermediates of IDM were identified by Thermo Scientific Ultimate 3000 RSLC High Resolution liquid chromatography coupled with Q Exactive Orbitrap mass spectrometry. Separation was accomplished using an Hypersil GOLD C18 (100 x 2.1 mm, 1.9 μm) with column temperature 40 °C. Elution was performed at a flow rate of 0.3 mL/min with water that contained 0.1 % (v/v) formic acid as eluent A, and methanol as eluent B. Mass spectral analysis was conducted in negative mode. Mass spectral analysis was conducted in negative mode. The mobile phase composition and mass spectrum scanning parameters have been listed in Table S1 to S3.

Text S3. Calculation Details

The electron-electron exchange and correlation interactions were described by using the generalized gradient approximation (GGA) with the form of the Perdew-Burke-

Ernzerhof (PBE)^{s1} functional. The projector augmented wave (PAW)^{s2, s3} method was employed to describe the interaction between the core and valence electrons. The wave functions were expanded in a plane wave basis sets with a cutoff energy of 500 eV. The convergence criteria for the electronic self-consistent iteration and the ionic relaxation loop were set as the values of 1×10^{-5} eV and 1×10^{-4} eV/Å, respectively. Brillouin zone integrations were performed with k-point sampling using Monkhorst-Pack (MP)^{s4} of $5 \times 5 \times 1$ for the models. The method of Gaussian smearing was employed to determine the valence electrons occupancies with a smearing width of 0.05 eV.

The optimized structure of BCN, CQD/BCN, and CQD/OUPCN were depicted in Fig. S1. The vacuum space was more than 15 Å, which was enough to avoid the interaction between periodical images. The lattice constant of BCN was calculated to be 7.13 Å which agrees to the published results^{s5, s6}.

TABLE***Table S1. Mobile phase composition and gradient elution.***

Time (min)	%A	%B
0	98	2
2	98	2
16	5	95
18	5	95
18.1	98	2
20	98	2

Table S2. Mass spectrum parameters.

Mass spectrum parameters	Value
Sheath gas flow rate	40
Aux gas flow rate	10
Sweep gas flow rate	0
Spray voltage (kV)	+3.5 , -2.5
Capillary temp. (°C)	320
Aux gas heater temp. (°C)	350

Table S3. Mass spectrum scanning parameters.

Mass spectrum scanning parameters	Value
Scan mode	Full MS-ddMS2
Full MS scan range	70-600 m/z
Resolution	Full MS: 70,000 FWHM MS/MS: 17,500 FWHM
Isolation width	2.0 m/z
NCE (Stepped NCE)	40 (50%)
