Materials and Methods

Fecal metabolomic analysis

Sample collection and metabolite extraction

Fresh fecal samples were collected in a 1.5-ml tube, immediately frozen in liquid nitrogen, and then stored at -80 °C. The fecal samples

(60 mg) were mixed with 600- μ L pre-cooled mixture of methanol and ultra-pure water (4:1, v/v) and subjected to ice-based sonication (500 W; 6 s on, 6 s off) for 10 min to extract metabolites. After incubation at -20 °C for 30 min, the samples were centrifuged at 13000 rpm for 15 min and the supernatant (0.2 mL) was collected for liquid chromatography-mass spectrometry (LC-MS) analysis. Quality control (QC) samples were prepared by pooling the aliquots of all samples.

LC-MS conditions

The following parameters were used for LC-MS analysis. Each sample (3 μ L) was injected and separated on an Acquity BEH C18 column (100 mm \times 2.1 mm i.d., 1.7 μ m; Waters, Milford, USA). The mobile phase A was 0.1% formic acid in water, and the mobile phase B was 0.1% formic acid in acetonitrile (ACN). The column was maintained at 45 °C, and the following solvent gradient was used: 5% B–25% B over 0–1.5 min, 25% B–100% B over 1.5–10.0 min, 100% B–100% B over 10.0–13.0 min, 100% B–5% B over 13.0–13.5 min, and 13.5–14.5 min holding at 5% B at a flow rate of 0.40 mL/min. The MS data were collected in a positive or negative ion mode. The gas temperature was set at 350 °C with a gas flow of 45 L/h, and data were collected from 50 to 1,000 m/z with a mass resolution of 30000.

Data processing and quality control settings

The parameters of XCMS were the same as previously described.¹

The variables present in at least 80% of the mice of either group were extracted, and the variables with a retention time of <0.5 min (near to the dead time) were excluded owing to the high degree of ion suppression. Variables with <30% relative standard deviation in QC samples were then retained for further multivariate data analysis. The result was a three-dimensional matrix, including retention time, m/z, sample names, and normalized ion intensities.

Jejunal proteomic analysis

Protein extraction

The collected jejunum samples were immediately stored at -80 °C until the use for protein extraction. The lysis buffer (1% sodium deoxycholate, 8 M urea, and protease inhibitor) was added to the tissue samples at a ratio of 15:1. After homogenizing, the samples were kept on ice for 30 min, centrifuged at 16000 ×g for 30 min, and the supernatants were collected.

Protein sample preparation and iTRAQ labeling

The extracted protein (100 µg in each sample) was reduced, alkylated, hydrolysis, and labeled with iTRAQ reagents as per the instruction manual (Applied Biosystems, USA). The labeled peptides were then pooled and dried using a rotary vacuum concentrator (Christ RVC 2-25, Christ, Germany). Each sample was labeled with one of eight

iTRAQ reagents. The iTRAQ experiment was performed with six replicates (three biological replicates \times two mechanical replicates in MS runs). Notably, each tube contained a mixture of jejunum tissues from three individuals, thus providing information of nine mice from each group (the Se-D, 0.15-SeL, 0.40-SeL, 0.15-SeM, and 0.40-SeM groups). Equal volumes of aliquots from 15 samples were mixed and labeled with 121 (Fig. 1) and served as an intermediate to interact the samples in three separate 8-plex iTRAQ labeling sets.

LC/LC–MS/MS analysis

The peptides were separated by high-pH reversed-phase liquid chromatography (RPLC, Waters ACQUITY UPLC) with ACQUITY UPLC BEH C18 Column 1.7 μ m, 2.1 mm \times 150 mm (Waters, USA). The solvents A and B were 2% ACN (adjusted to pH 10 by ammonia) and 80% ACN (adjusted to pH 10 by ammonia), respectively. The gradient elution was performed as follows: t = 0–2 min, 0% B; t = 17 min, 3.8% B; t = 35 min, 24% B; t = 38 min, 30% B; t = 39 min, 43% B; t = 40 min, 100% B; t = 46 min, 0% B; t = 66 min, stop. LC-MS/MS analyses of all of the collected fractions were performed using an EASY-nLC 1200 system (Thermo Scientific) connected to a Q Exactive mass spectrometer (Thermo Fisher Scientific, USA). A peptide sample was loaded onto the C18 column (75 μ m \times 25 cm, Thermo, USA). The solvents A and B used for separation were 2% ACN containing 0.1% formic acid and 80% ACN

containing 0.1% formic acid, respectively. The gradient elution was performed as follows: t = 0, 0% B; t=1, 5% B; t = 63, 23% B; t = 88, 48% B; t = 89, 100% B; t = 95, 100% B; t = 100, 0% B; t = 120, 0% B.

The Q Exactive mass spectrometer was operated in the data-dependent mode to switch automatically between MS and MS/MS acquisition modes. Survey full-scan MS spectra (m/z 350 to 1300) were acquired with a mass resolution of 70 K, followed by MS/MS scans with a resolution of 17.5 K.

^aThe difference in the abundance of each metabolite is expressed as the ratio of its average content in the Se-D group and in the 0.15-SeL group (Se-D/0.15-SeL). A ratio of >1 indicates that the corresponding metabolite had higher abundance in the Se-D group, whereas a ratio of <1 indicates that the corresponding metabolite has lower abundance in the Se-D group. ^bDifferences in metabolite abundances between the Se-D and 0.15-SeL groups were analyzed using one-way analysis of variance, followed by the Tukey's post hoc test. $P < 0.05$ was considered as significant.

^aThe difference in the abundance of each metabolite is expressed as the ratio of its average content in the Se-D group and in the 0.15-SeM group (Se-D/0.15-SeM). A ratio of >1 indicates that the corresponding metabolite had higher abundance in the Se-D group, whereas a ratio of <1 indicates that the corresponding metabolite has lower abundance in the Se-D group. ^bDifferences in metabolite abundances between the Se-D and 0.15-SeM groups were analyzed using one-way analysis of variance, followed by the Tukey's post hoc test. $P < 0.05$ was considered as significant.

Table S5 Significantly altered fecal metabolites in the 0.40-SeM/0.15-SeM comparison

^aThe difference in the abundance of each metabolite is expressed as the ratio of its average content in the 0.40-SeM group and in the 0.40-SeL group (0.40-SeM/0.40-SeL). A ratio of >1 indicates that the corresponding metabolite had higher abundance in the 0.40-SeM group, whereas a ratio of <1 indicates that the corresponding metabolite has lower abundance in the 0.40-SeM group. ^bDifferences in metabolite abundances between the 0.40-SeM and 0.40-SeL groups were analyzed using one-way analysis of variance, followed by the Tukey's post hoc test. *P* < 0.05 was considered as significant.

^aThe accession ID of each protein in the Uniprot database. ^bThe gene name and protein description of each protein in the Uniprot database. ^cThe fold change value of each differentially expressed protein in the 0.40-SeM/0.15-SeM comparison. ^dDifferences in protein abundances between the 0.40-SeM and 0.15-SeM groups were analyzed using one-way analysis of variance, followed by the Tukey's post hoc test. $P < 0.05$ was considered as significant. The value 0 indicates $P < 0.0001$.
