

1 **Supplement Figure 1. Effects of DHPV blocked the G1 phase during mitotic clonal expansion.** Cells
2 were harvested at the indicated time after the initiation of differentiation with or without DHPV treatment
3 and stained with PI solution for flow cytometer cell cycle analysis. The histogram results indicate cell cycle
4 distribution in G1, S or G2/M phases. Data were represented as mean \pm SEM values. Each experiment was
5 repeated at least 3 times independently. To compare the differences among the groups, one-way ANOVA
6 was used with Duncan's multiple range tests. Different letters indicated statistically significant differences at
7 $p < 0.05$.
