## General Information

Melting points were measured with a melting point instrument and were uncorrected. <sup>1</sup>H NMR and <sup>13</sup>C NMR spectra were recorded on Bruker 400 (<sup>1</sup>H, 400 MHz; <sup>13</sup>C, 100 MHz) instrument internally referenced to tetramethylsilane (TMS) or CDCl<sub>3</sub> signals. The NMR data were collected at ambient temperature and Chemical shifts are reported in parts per million (ppm) relative to the NMR solvent peaks. Data for <sup>1</sup>H-NMR are reported as follows: chemical shift, multiplicity (br: broad, s: singlet, d: doublet, t: triplet, m: multiplet), coupling constants, and integration. Infrared spectra were obtained with a PerkinElmer Spectrum Two. High-resolution mass-spectra (HRMS) were acquired on an Agilent 1290 Infinity separations module coupled to a 6230 time of flight (TOF) mass detector operating in ESI+ or ESI- mode. TLC was performed by using commercially prepared 200-400 mesh silica gel plates (GF254) and visualization was effected at 254 nm. Processing of the NMR data was done using the standard Mestrenova 9.0.1 software. The powder X-ray diffraction (XRD) patterns were recorded by a Rigaku D/max-2500 X-ray diffractometer using Cu-Kα radiation. Fourier transform infrared (FTIR) spectra were recorded in the range of 400-4000 cm<sup>-1</sup> using a BOMEM DA-8 FT-IR spectrometer employing potassium bromide (film) pellets technique at room temperature. The morphology of the materials was obtained on JEOL JEM-2010F High Resolution Transmission Electron Microscope (HRTEM). The X-ray photoemission (XPS) spectra were performed at room temperature using a Thermo ESCALAB 250xi hemispherical electron energy analyser. Elemental analysis was conducted on a PerkinElmer 2400 elemental analyzer. Thermal gravimetric (TG) analysis was conducted on a TG-DSC instrument (TGA5500) under a N<sub>2</sub> atmosphere at a heating rate of 10 °C/min from 25 to 700°C. The ball mill model is YXQM-4L planetary ball mill (Changsha Miqi Instrument Equipment Co., Ltd., China). The were heated using a MM823LA6-NS for Microwave oven (China Midea Electric Company; Output power 540W).

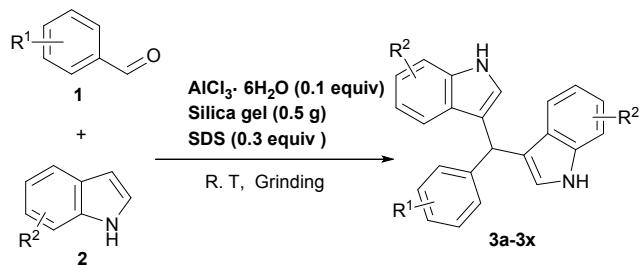

Materials: All reagents were used as received from commercial sources and all of the analytically pure. The benzaldehyde was re-distilled and purified.

## Experimental condition optimization

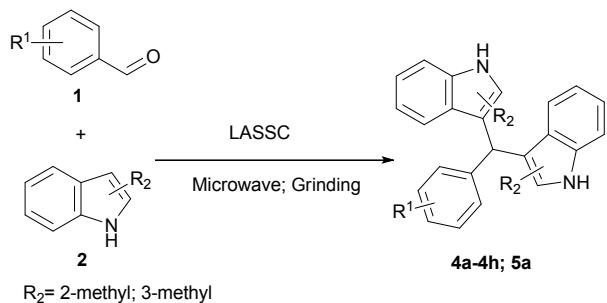

The mixture of indole **1** (2.0 mmol), 4-nitrobenzaldehyde **2** (1.0 mmol), sodium dodecyl sulfate (SDS: 0.3 mmol), Lewis acid metal salt (MCl<sub>x</sub>·6H<sub>2</sub>O: 0.1 mmol; M= Al, Fe, Zn, Mg; x:2 or 3) and column chromatography silica gel (0.5g; 300-400 mesh) in agate mortarwas grinded at room temperature without solvent under air for 20-50 min. After the reaction is completed, the reaction mixture was dissolved in ethyl acetate (10mL) and filtered. The filtrate was concentrated, and the residue was purified with silica gel chromatography (Petroleumether / EtOAc =3:1) to give product **3a**. The filtered solid mixture was dried for and then used for the next reaction.

## Experimental Procedure for Compounds **3a-3x**.

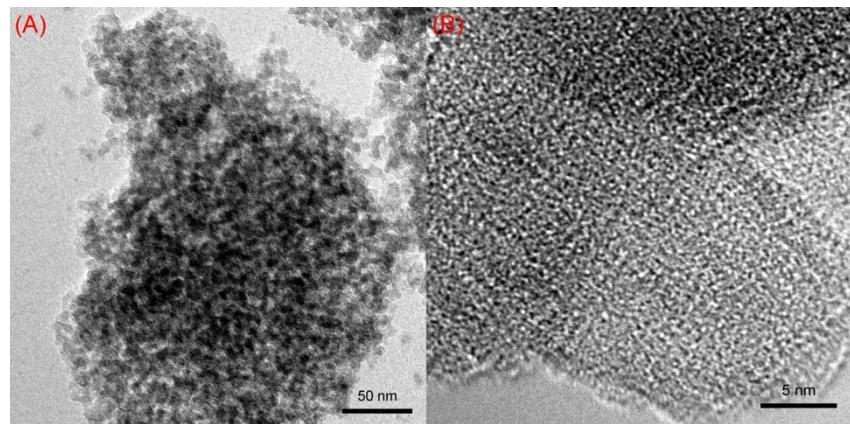

The mixture of aromatic aldehyde **1** (1.0 mmol), indole compound **2** (2.0 mmol), SDS: 0.3 mmol, AlCl<sub>3</sub>·6H<sub>2</sub>O:0.1 mmol and column chromatography silica gel 0.5 g (300-400 mesh) in agate mortar was grinded at room temperature without solvent under air for 10-45 min. After the reaction is completed, the reaction mixture was dissolved in ethyl acetate (10mL) and filtered. The filtrate was concentrated, and the residue was purified with silica gel chromatography ( Petroleumether / EtOAc =2:1-5:1) to give product **3a-3x**.

## Experimental Procedure for Compounds **4a-4h** and **5a**

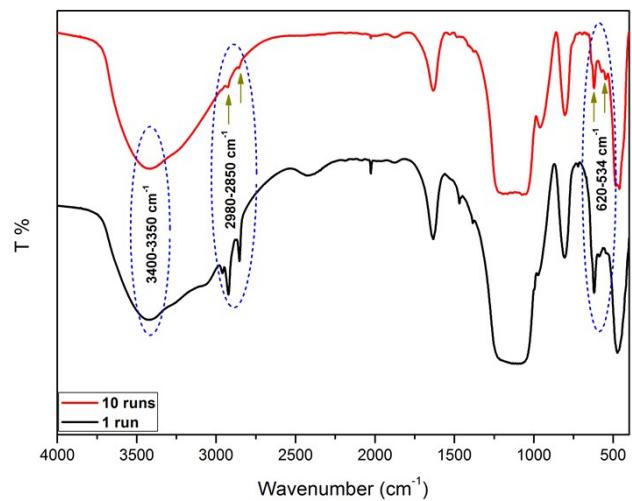

The mixture of aromatic aldehyde or aromatic ketone **1** (1.0 mmol), 2-methylindole or 3-methylindole **2** (2.0 mmol), SDS: 0.3mmol, AlCl<sub>3</sub>·6H<sub>2</sub>O:0.1 mmol and column chromatography silica gel 0.5 g (300-400 mesh) in agate mortar was grinded at room temperature without solvent under microwave for 3-10 min. After the reaction is completed, the reaction mixture was dissolved in ethyl acetate (10mL) and filtered. The filtrate was concentrated, and the residue was purified with silica gel chromatography (Petroleumether/EtOAc =1:1-3:1 ) to give product **4a-4h** and **5a**.

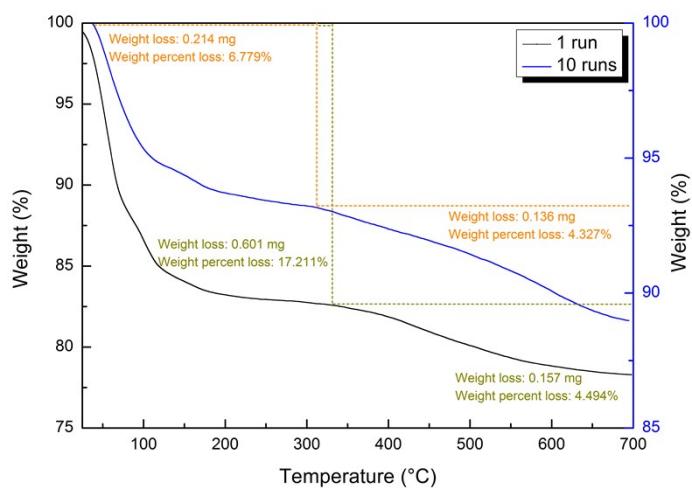

## HRTEM , IR and TG analysis

**Fig. S1** The HRTEM after 10 cycles of LASSC catalyst recycling.

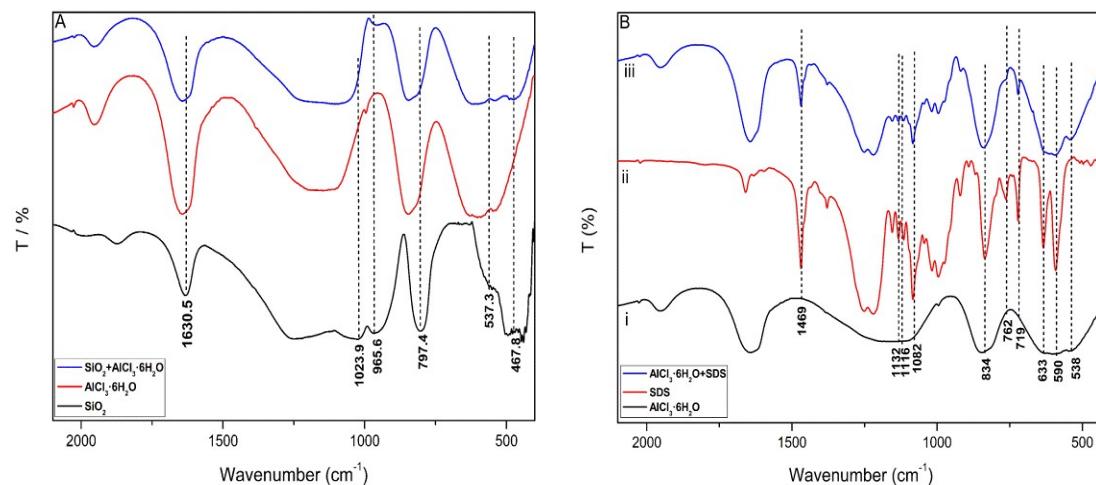

**Fig. S2** The FT-IR for catalyst reuse.

**Fig. S3** TG curve after 1 and 10 cycles of LASSC catalyst (25-700°C)

## The FT-IR LASSC system.

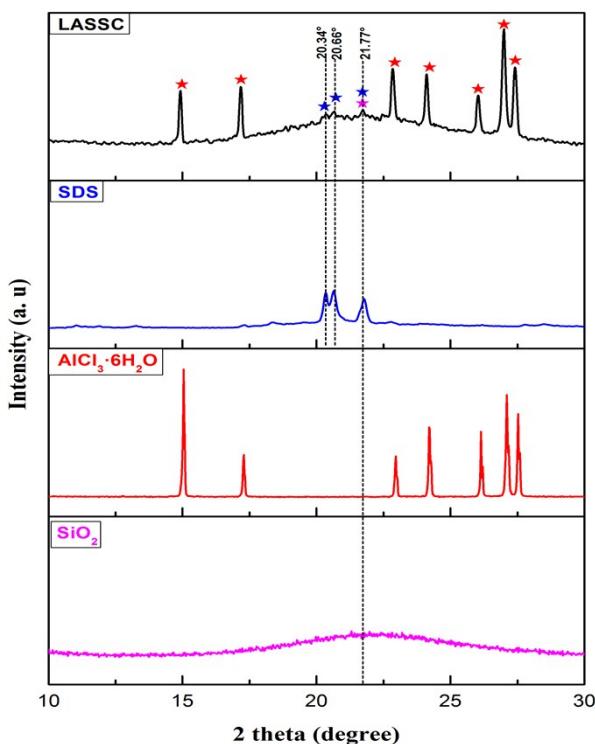

**Fig. S4** FT-IR images of each component of LASSC catalytic system (A and B).

FT-IR characterization has proven to be a powerful technique for the study of components and structure of catalyst including organic segments. As seen from Fig. S4-A, it is that a large amount of inter-layer water molecules are present in the silica.  $1630.5\text{ cm}^{-1}$  represents the H-O-H bending vibration absorption peak;  $1023.9\text{ cm}^{-1}$  is the asymmetric stretching vibration absorption peak of the Si-O-Si bond;  $965.6\text{ cm}^{-1}$  and  $797.4\text{ cm}^{-1}$  correspond to the Si-OH stretching vibration peak and the Si-O characteristic peak, respectively.<sup>1</sup> The mixture of  $\text{SiO}_2$  and  $\text{AlCl}_3 \cdot 6\text{H}_2\text{O}$  was solid phase milled, and the infrared spectrum showed a slight change. The apparent disappearance of the absorption peak at  $1023.9\text{ cm}^{-1}$  and the decrease in the peak intensity at  $965.6\text{ cm}^{-1}$  are attributed to the loss of the Si-O-Si group and the change of the Si-OH group. In addition, changes have occurred, representing Si-O-Al and Si-O characteristic peaks at  $537.3\text{ cm}^{-1}$  and  $467.8\text{ cm}^{-1}$ , respectively. The peak here is significantly enhanced after grinding, which also indicates that crystalline aluminum chloride and silica form a Si-O-Al functional group by hydroxyl dehydration. This has occurred to some extent by chemical bonding, with a large amount of hydroxyl groups on the surface.

The spectrum of SDS shows bands at  $590\text{ cm}^{-1}$ , and  $633\text{ cm}^{-1}$  corresponding to the bending vibration of  $\text{SO}_3^-$ , and peaks at  $1082$ ,  $1116$ , and  $1132\text{ cm}^{-1}$  ascribing to the stretching vibration of  $\text{SO}_3^-$ .<sup>2</sup> However, Fig. S4-B shows a weak characteristic peak at the position of  $538\text{ cm}^{-1}$ , but no characteristic peak appears at  $590$  and  $633\text{ cm}^{-1}$ , and other positions such as  $1082$ ,  $1116$ , and  $1132\text{ cm}^{-1}$  all exhibit characteristic peaks representing  $\text{SO}_3^-$ . The position and intensity of  $\text{SO}_3^-$  was found to be very sensitive to the changes of chemical environments caused by metal ions coordination. Comparing FT-IR spectra of SDS (Fig. S4-B-ii and S4-B-iii), we found that the bending and stretching vibration of  $\text{SO}_3^-$  degenerated obviously, and positions changed greatly. This is attributed to the coordination of the SDS in the catalyst system with the Al atoms in the crystalline aluminum chloride by hydrogen bonding.

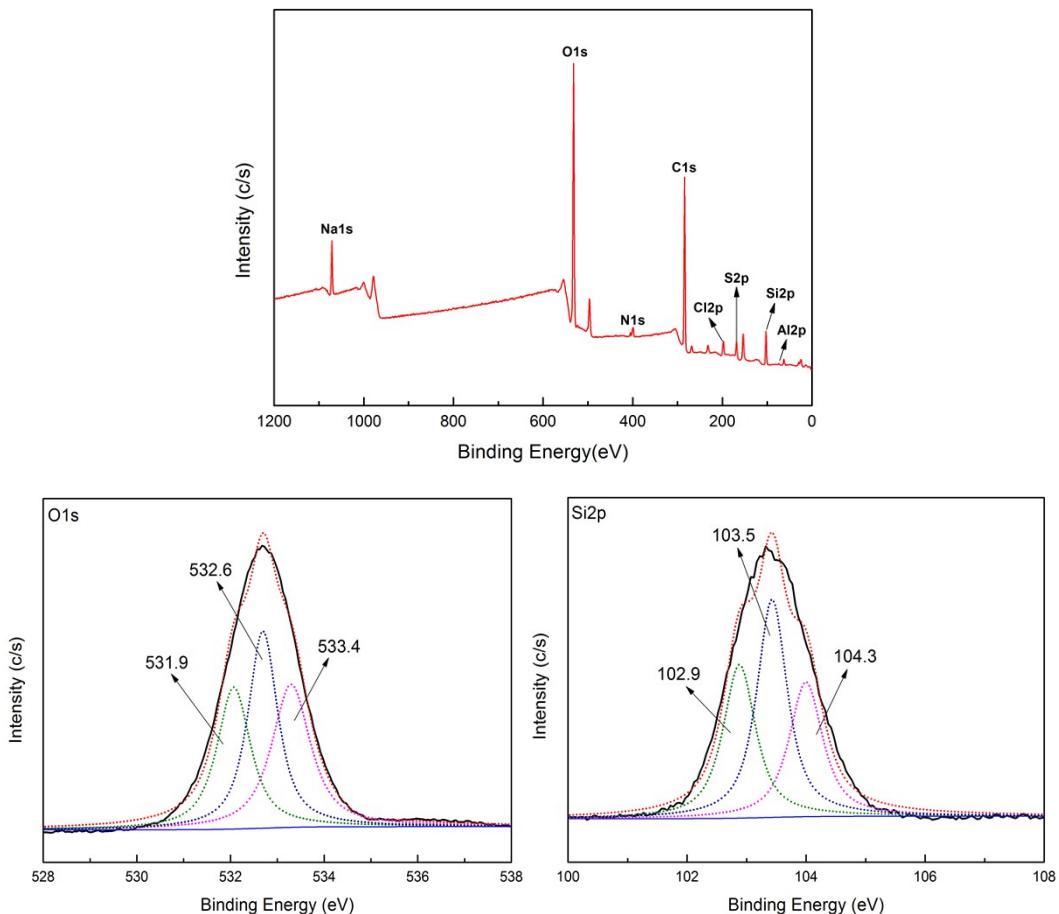

## XRD Analysis

**Fig. S5** The XRD analysis of LASSC catalytic system.

Fig. S5 is an XRD analysis of the components of the LASSC catalytic system. The strong reflections of SDS were observed at lower diffraction angles at  $2\theta = 20.34^\circ$ ,  $20.66^\circ$  and  $21.77^\circ$ , corresponding to  $0.436\text{nm}$ ,  $0.429\text{nm}$  and  $0.408\text{nm}$  calculated by Bragg's law, respectively. By comparison, it was found that the peak intensity of  $\text{SiO}_2$  was at  $22.76^\circ$ , which almost coincided with  $21.77^\circ$  of SDS. It is worth noting that the intensity of the diffraction peaks disappeared significantly at  $20.34$  and  $20.66$  in the LASSC system. Due to the interaction of SDS with  $\text{AlCl}_3 \cdot 6\text{H}_2\text{O}$  in the LASSC system, the hydration state of the SDS is increased, resulting in a decrease in the layer spacing of the catalyst network. It has been generally known that crystalline phases of SDS all have similar bilayer structures, in which the dodecylsul-fate molecules are stacked in a head to head, tail to tail mode, alternating alkyl chains and sulfate head-group.<sup>3</sup> Also, in view of the layered structure of the SDS, the LASSC catalyst composition exhibits lattice fringes and spacing on the nanometer scale. By calculating its lattice spacing to be  $0.211\text{ nm}$ , it is approximately equal to the monolayer structure of SDS. The mass ratio of SDS,  $\text{AlCl}_3 \cdot 6\text{H}_2\text{O}$  and  $\text{SiO}_2$  in the LASSC system is about  $3:1:25$ . Such a small amount but very excellent catalytic performance, thanks to the nanostructure and catalytic properties of LASSC. The excellent catalytic properties are also manifested in the multiple cycle life of the catalyst.

## XPS Analysis

**Fig. S6** XPS spectra of LASSC (including Si and O).

The O1s spectra measured consist of peaks at 531.9eV, 532.6eV and 533.4eV, corresponding to O1s in sulfate, -O-H and SiO<sub>2</sub>, respectively. These results indicate that the nanomaterial has SiO<sub>2</sub> as a carrier and an organic sulfonate SDS supported on its surface. The peak of Si2p is at 103.5eV, which is in agreement with Si2p in SiO<sub>2</sub> (103.6 eV).<sup>4-5</sup> In XPS spectrum of LASSC, two peaks of Si2p appear at 102.9eV and 104.3eV, respectively. As hydroxyl is electron withdrawing group, the binding energy of Si2p in -Si-OH on the particle surface shifts to 104.3eV. The higher intensity Si2p peak at 102.9eV is attributed to the interaction of the hydroxyl group on the surface of SiO<sub>2</sub> with AlCl<sub>3</sub>·6H<sub>2</sub>O, where the group Si-O-Al is a strong donor group, so the binding energy is lower than that of pure SiO<sub>2</sub> (103.5eV). As the amount of -OH is greatly reduced after the reaction of -Si-OH with -Al-OH, the peak of -Si-OH becomes weak. The peak appearing at 104.3eV of lower binding energy is considered to be an overlap of the Si2p peak (103.5eV) of SiO<sub>2</sub> and the residual -Si-OH (104.3eV). The peak areas of the two are nearly equal, indicating that AlCl<sub>3</sub>·6H<sub>2</sub>O is uniformly dispersed on the surface of SiO<sub>2</sub>. And using SiO<sub>2</sub> as a carrier, SDS and AlCl<sub>3</sub>·6H<sub>2</sub>O are tightly fixed on their surface. It can be concluded that the SDS and AlCl<sub>3</sub>·6H<sub>2</sub>O is interacted to SiO<sub>2</sub> surface

via chemical bond. According to the results of IR and XPS, we can further affirm that the SDS and  $\text{AlCl}_3 \cdot 6\text{H}_2\text{O}$  is bonded to the surface of  $\text{SiO}_2$ .

**Table S1** The conventional LASCs catalyst preparation of each component.

LASCs	Dosage of each component	LASSC (This work)
$^7\text{Sc}(\text{DS})_3$	SDS(11.6mmol)+Water(50mL) $\text{ScCl}_3 \cdot 6\text{H}_2\text{O}$ (3.85mmol)+Water(50mL) Water for washing (250mL).	SDS (0.3mmol; 87 mg); $\text{AlCl}_3 \cdot 6\text{H}_2\text{O}$ (0.1mmol; 24 mg); $\text{SiO}_2$ (50 mg); Solvent free; Cycle more than 10 times.
$^8\text{Ce}(\text{DS})_3$	SDS(11.6mmol)+Water(50mL) $\text{CeCl}_3 \cdot 7\text{H}_2\text{O}$ (3.85mmol)+Water(50mL) Water for washing (250mL)	
$^9\text{Fe}(\text{DS})_3$	SDS(11.6mmol)+Water(80mL) $\text{FeCl}_3 \cdot 6\text{H}_2\text{O}$ (3.85mmol)+Water(20mL) Water for washing (250mL)

## Experiment to obtain intermediates

The mixture of 4-nitrobenzaldehyde **1** (1.0 mmol), indole **2** (2.0 mmol), and column chromatography silica gel 0.5 g (300-400 mesh) in agate mortar was grinded at room temperature without solvent under air for 35-50 min. After the reaction is completed, the reaction mixture was dissolved in ethyl acetate (10mL) and filtered. The filtrate was concentrated, and the residue was purified with silica gel chromatography ( Petroleumether / EtOAc =3:1) to give product **3b** and reaction intermediate (Marked as **A**).

**Fig. S7** The thin layer chromatography plate for intermediates.

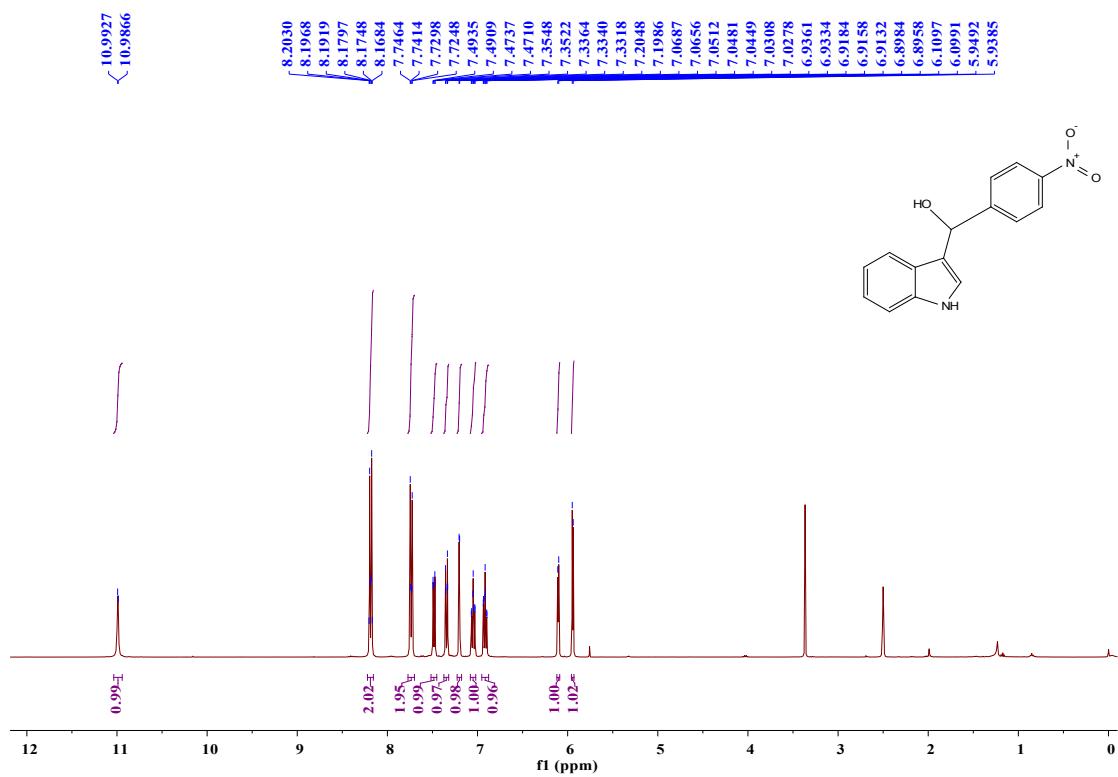

(**1**: 4-nitrobenzaldehyde; **2**: Indole; **3b**: Target product; **A**: Intermediate product)

Fig. S7 is a thin layer chromatography plate for obtaining an intermediate experiment. After the reaction reached equilibrium, the reaction materials **1** and **2** did not completely react. However, we obtained both the target product **3b** and the intermediate **A**. By the purification treatment, the target product **3b** was obtained in a yield of 11 %; at the same time, a stable pale yellow reaction intermediate **A** was obtained in a yield of 10 %. The structure was further confirmed by NMR and FT-IR. This is the first time to obtain the target product and intermediate in the "one-pot" reaction by delaying the reaction time and rate, which provides favorable evidence for the reaction catalytic mechanism. It has been proved by experiments that the intermediate we obtained is a tertiary alcohol structure. This is consistent with the literature synthesis.<sup>6</sup>

**3,3'-(4-nitrophenyl)methylenebis(6-methoxy-1*H*-indole) (3v)**

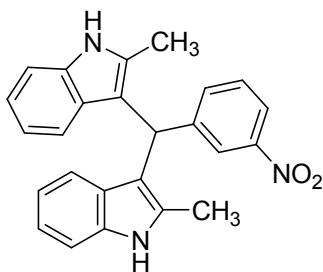

Brown solid (46%); mp=112.8-114.2°C; **<sup>1</sup>H NMR** (400 MHz, CDCl<sub>3</sub>) δ 8.16 – 8.05 (m, 2H), 7.99 – 7.86 (m, 2H), 7.52 – 7.42 (m, 2H), 7.19 (d, *J* = 8.7 Hz, 2H), 6.85 (d, *J* = 2.3 Hz, 2H), 6.69 (dd, *J* = 8.7, 2.2 Hz, 2H), 6.58 – 6.52 (m, 2H), 5.88 (s, 1H), 3.82 (s, 6H). **<sup>13</sup>C NMR** (100 MHz, CDCl<sub>3</sub>) δ 156.6, 152.0, 146.5, 137.4, 129.5, 123.6, 122.4, 121.1, 120.2, 118.1, 109.5, 94.7, 55.7, 40.3. **IR** (thin film) ν<sub>max</sub>3410.6; 2923.5; 2849.3; 1628.2; 1536.0; 1515.9; 1452.2; 1345.2; 1260.2; 1232.5; 1159.3; 1058.0; 1026.2. **ESI-MS** Expected C<sub>25</sub>H<sub>21</sub>N<sub>3</sub>O<sub>4</sub>: 427.15; Observed 426.1174.

## Characterization data for all products 4a-4h and 5a

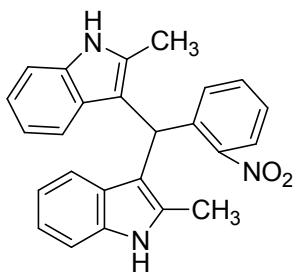

### 3,3'-(4-nitrophenyl)methylenebis(2-methyl-1H-indole) (4a)

Yellow solid (95%); **1H NMR** (400 MHz, DMSO-*d*<sub>6</sub>) δ 10.90 (s, 2H), 8.24 – 8.12 (m, 2H), 7.44 (d, *J* = 8.5 Hz, 2H), 7.26 (d, *J* = 8.1 Hz, 2H), 6.93 (t, *J* = 7.5 Hz, 2H), 6.82 (d, *J* = 8.0 Hz, 2H), 6.72 (t, *J* = 7.5 Hz, 2H), 6.09 (s, 1H), 2.12 (s, 6H). **13C NMR** (100 MHz, DMSO-*d*<sub>6</sub>) δ 152.9, 145.7, 135.1, 132.6, 129.8, 127.9, 123.3, 119.8, 118.3, 118.2, 110.9, 110.5, 39.1, 12.0. **IR** (thin film) ν<sub>max</sub> 3398.9; 2919.1; 1548.9; 1516.0; 1343.9; 1287.8; 1260.9; 747.9.

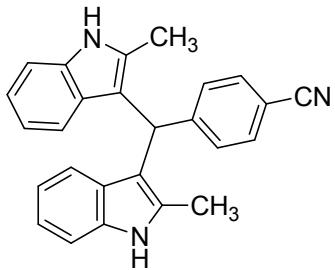

### 3,3'-(3-nitrophenyl)methylenebis(2-methyl-1H-indole) (4b)

Yellow solid (95%); **1H NMR** (400 MHz, DMSO-d6) δ 10.91 (s, 2H), 8.16 – 8.08 (m, 1H), 8.05 (s, 1H), 7.67 (d, *J* = 7.7 Hz, 1H), 7.55 (t, *J* = 7.9 Hz, 1H), 7.29 (d, *J* = 8.1 Hz, 2H), 6.94 (t, *J* = 7.5 Hz, 2H), 6.85 (d, *J* = 8.0 Hz, 2H), 6.73 (t, *J* = 7.5 Hz, 2H), 6.15 (s, 1H), 2.15 (s, 6H). **13C NMR** (100 MHz, DMSO-*d*<sub>6</sub>) δ 147.7, 147.0, 135.5, 135.2, 132.6, 129.5, 127.9, 122.9, 121.0, 119.8, 118.2, 111.0, 110.6, 38.3, 12.0, 11.9. **IR** (thin film) ν<sub>max</sub> 3393.3; 2919.3; 2878.5; 1645.9; 1548.8; 1525.5; 1459.9; 1345.9; 749.3

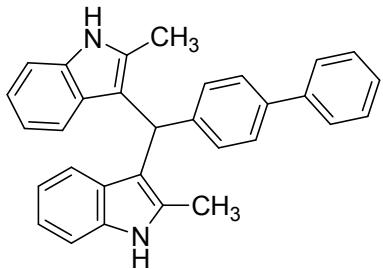

### 3,3'-(2-nitrophenyl)methylenebis(2-methyl-1H-indole) (4c)

Yellow solid (89%); **<sup>1</sup>H NMR** (400 MHz, DMSO-*d*<sub>6</sub>) δ 10.87 (s, 2H), 7.85 (dd, *J* = 7.9, 1.5 Hz, 1H), 7.57 (td, *J* = 7.6, 1.5 Hz, 1H), 7.49 (td, *J* = 7.6, 1.5 Hz, 1H), 7.29 (dd, *J* = 7.9, 1.5 Hz, 1H), 7.25 (d, *J* = 8.0 Hz, 2H), 6.92 (ddd, *J* = 8.1, 6.6, 1.5 Hz, 2H), 6.79 – 6.67 (m, 4H), 6.61 (s, 1H), 2.06 (s, 6H). **<sup>13</sup>C NMR** (100 MHz, DMSO-*d*<sub>6</sub>) δ 150.1, 137.8, 135.0, 132.7, 132.4, 130.5, 128.1, 127.7, 124.5, 119.8, 118.3, 117.7, 110.6, 109.8, 33.9, 11.6. **IR** (thin film) ν<sub>max</sub> 3400.3; 2917.9; 2780.0; 1523.3; 1318.2; 1260.8; 749.8.

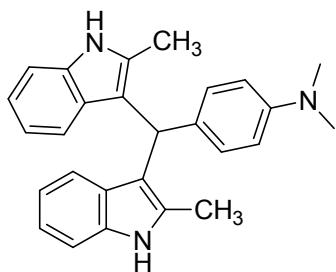

**4-(bis(2-methyl-1H-indol-3-yl)methyl)benzonitrile (4d)**

Yellow solid (86%); **<sup>1</sup>H NMR** (400 MHz, DMSO-*d*<sub>6</sub>) δ 10.86 (d, *J* = 5.7 Hz, 2H), 7.73 (d, *J* = 7.9 Hz, 2H), 7.38 (d, *J* = 7.7 Hz, 2H), 7.26 (d, *J* = 7.8 Hz, 2H), 6.92 (t, *J* = 7.4 Hz, 2H), 6.81 (d, *J* = 7.9 Hz, 2H), 6.72 (t, *J* = 7.4 Hz, 2H), 6.03 (d, *J* = 5.4 Hz, 1H), 2.10 (d, *J* = 5.3 Hz, 6H). **<sup>13</sup>C NMR** (100 MHz, DMSO-*d*<sub>6</sub>) δ 150.5, 135.1, 132.5, 131.9, 129.7, 127.9, 119.7, 119.1, 118.3, 118.2, 110.9, 110.5, 108.5, 38.8, 11.9. **IR** (thin film) ν<sub>max</sub> 3396.9; 2918.8; 2778.0; 1459.9; 748.4.

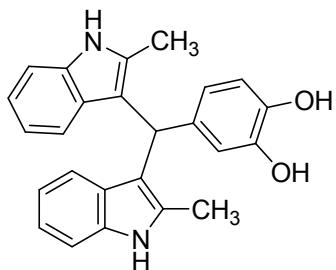

**3,3'-([1,1'-biphenyl]-4-ylmethylen)e bis(2-methyl-1H-indole) (4e)**

Yellow solid (83%); **<sup>1</sup>H NMR** (400 MHz, DMSO-*d*<sub>6</sub>) δ 10.80 (s, 2H), 7.71 – 7.63 (m, 2H), 7.58 (d, *J* = 8.3 Hz, 2H), 7.42 (t, *J* = 7.7 Hz, 2H), 7.33 (d, *J* = 7.1 Hz, 2H), 7.29 – 7.23 (m, 2H), 6.92 (t, *J* = 7.3 Hz, 4H), 6.77 – 6.68 (m, 2H), 6.00 (s, 1H), 2.14 (s, 6H). **<sup>13</sup>C NMR** (100 MHz, DMSO-*d*<sub>6</sub>) δ 143.7, 140.0, 137.4, 135.1, 132.1, 129.3, 128.9, 128.3, 127.1, 126.4, 126.1, 119.6, 118.6, 118.0, 112.1, 110.4, 38.3, 12.0. **IR** (thin film) ν<sub>max</sub> 3400.4; 2917.7; 1485.8; 1459.7; 1324.3; 742.6; 712.4.

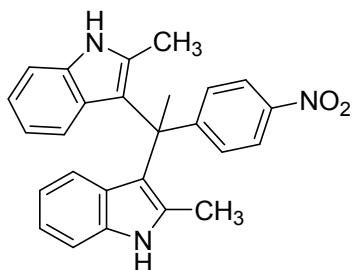

**4-(bis(2-methyl-1H-indol-3-yl)methyl)-N,N-dimethylaniline (4f)**

Yellow solid (46%); **1H NMR** (400 MHz, DMSO-*d*<sub>6</sub>) δ 10.68 (s, 2H), 7.24 – 7.17 (m, 2H), 7.00 (d, *J* = 8.4 Hz, 2H), 6.93 – 6.84 (m, 4H), 6.68 (dd, *J* = 8.2, 6.8 Hz, 2H), 6.65 – 6.57 (m, 2H), 5.81 (s, 1H), 2.83 (s, 6H), 2.07 (s, 6H). **13C NMR** (100 MHz, DMSO-*d*<sub>6</sub>) δ 148.6, 135.0, 131.8, 131.7, 129.1, 128.4, 119.4, 118.6, 117.8, 112.9, 112.2, 110.2, 40.3, 37.6, 11.95. **IR** (thin film) ν<sub>max</sub> 3387.8; 2918.4; 2771.4; 1275.4; 1270.1; 1260.9; 760.1; 750.1.

**4-(bis(2-methyl-1H-indol-3-yl)methyl)benzene-1,2-diol (4g)**

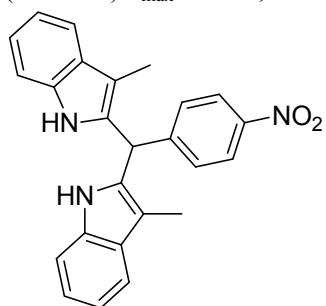

Yellow solid (99.8%); **1H NMR** (400 MHz, DMSO-*d*<sub>6</sub>) δ 10.69 (s, 2H), 8.62 (d, *J* = 26.0 Hz, 2H), 7.20 (d, *J* = 7.9 Hz, 2H), 6.93 – 6.82 (m, 4H), 6.69 (t, *J* = 7.5 Hz, 2H), 6.65 – 6.58 (m, 2H), 6.49 – 6.41 (m, 1H), 5.75 (s, 1H), 2.07 (s, 6H). **13C NMR** (100 MHz, DMSO-*d*<sub>6</sub>) δ 144.7, 143.1, 135.1, 135.0, 131.8, 128.4, 119.4, 118.7, 117.8, 116.3, 115.1, 112.9, 110.2, 37.9, 12.0. **IR** (thin film) ν<sub>max</sub> 3398.4; 2919.5; 2779.5; 1459.9; 1275.9; 748.7.

**3,3'-(1-(4-nitrophenyl)ethane-1,1-diyl)bis(2-methyl-1H-indole) (4h)**

Yellow solid (17%); **1H NMR** (400 MHz, DMSO-*d*<sub>6</sub>) δ 10.83 (s, 2H), 8.16 (d, *J* = 8.4 Hz, 2H), 7.61 (d, *J* = 8.5 Hz, 2H), 7.27 (d, *J* = 8.0 Hz, 2H), 6.94 (t, *J* = 7.5 Hz, 2H), 6.78 (d, *J* = 8.2 Hz, 2H), 6.69 (t, *J* = 7.6 Hz, 2H), 2.49 (s, 3H), 1.74 (s, 6H). **13C NMR** (100 MHz, DMSO-*d*<sub>6</sub>) δ 157.7,

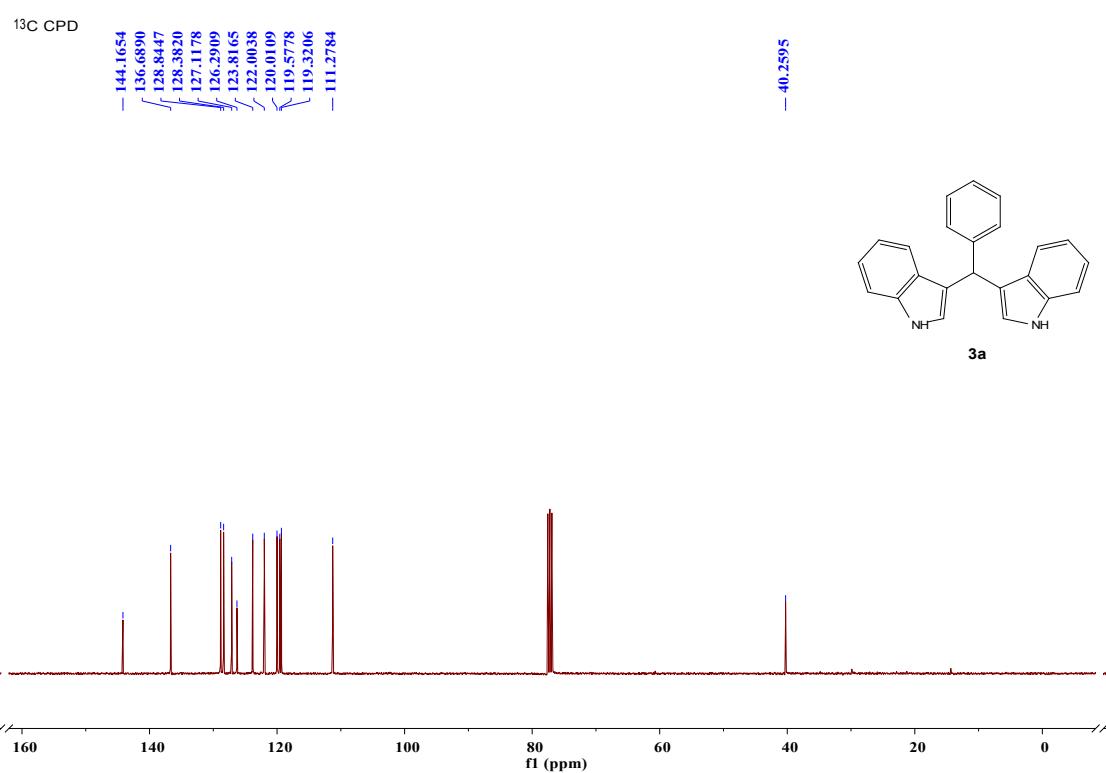

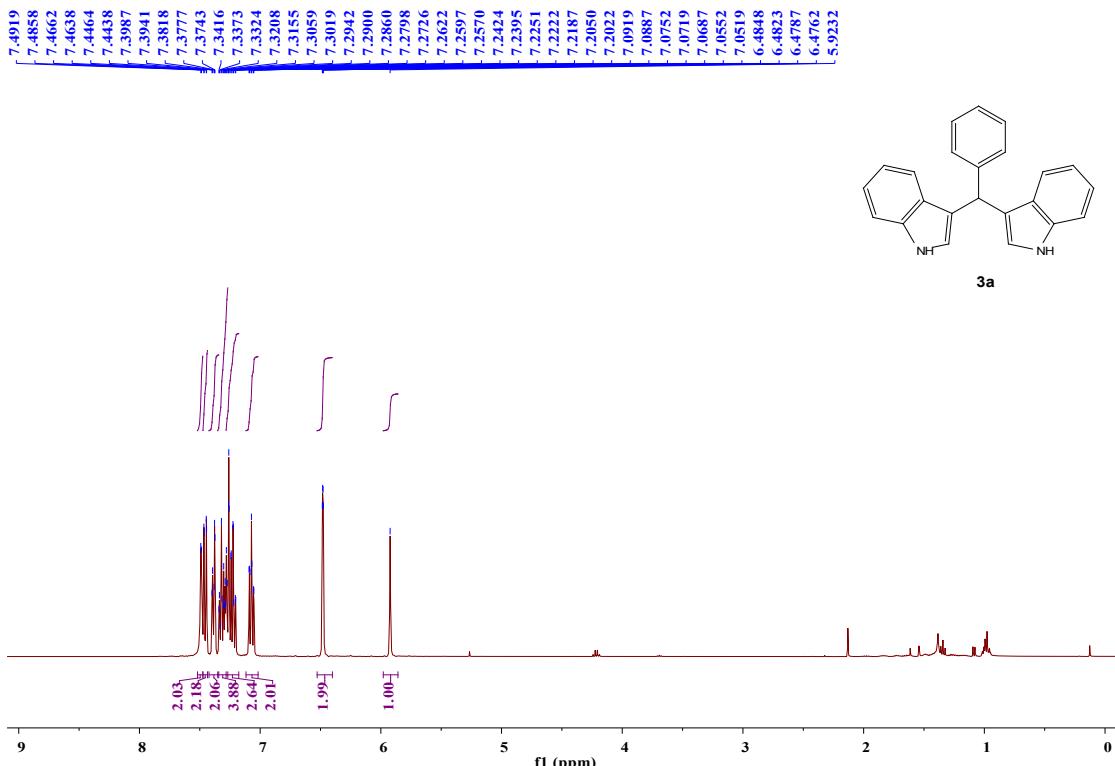

145.4, 135.0, 132.0, 129.5, 127.8, 122.8, 120.2, 119.6, 118.0, 116.5, 110.4, 44.8, 31.5, 13.6. **IR** (thin film)  $\nu_{\text{max}}$  3398.7; 2923.5; 2880.5; 1659.2; 1563.2; 1458.2; 1263.7; 741.9.

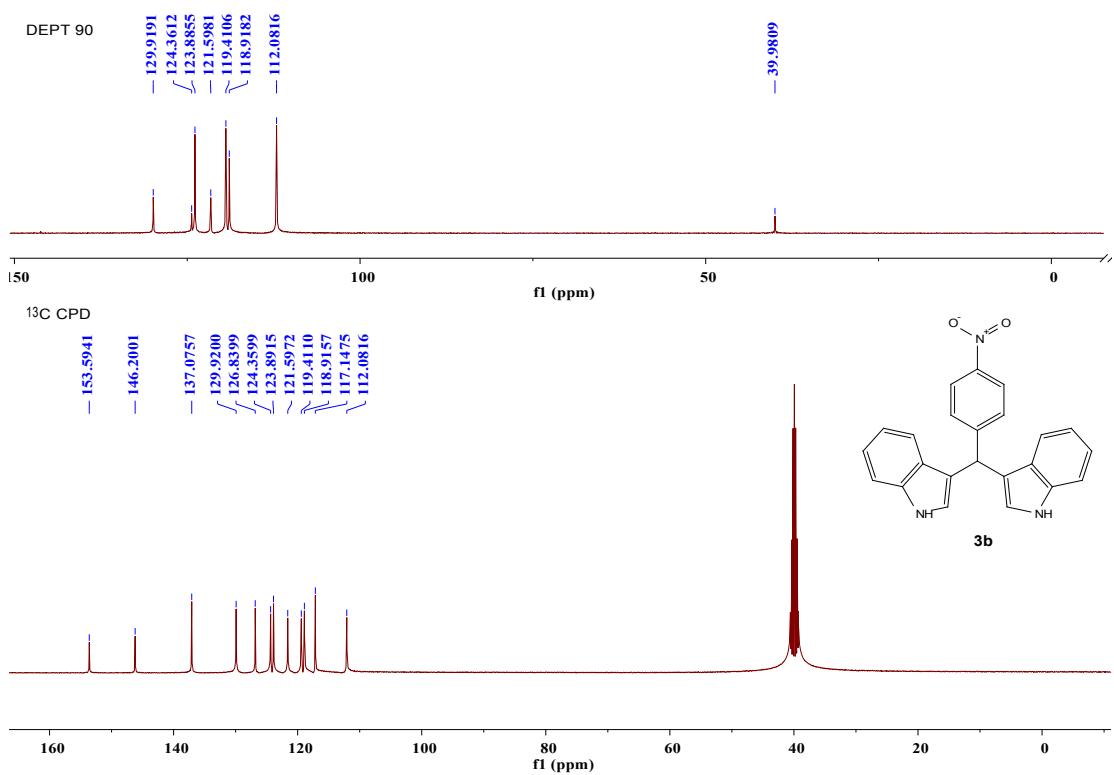

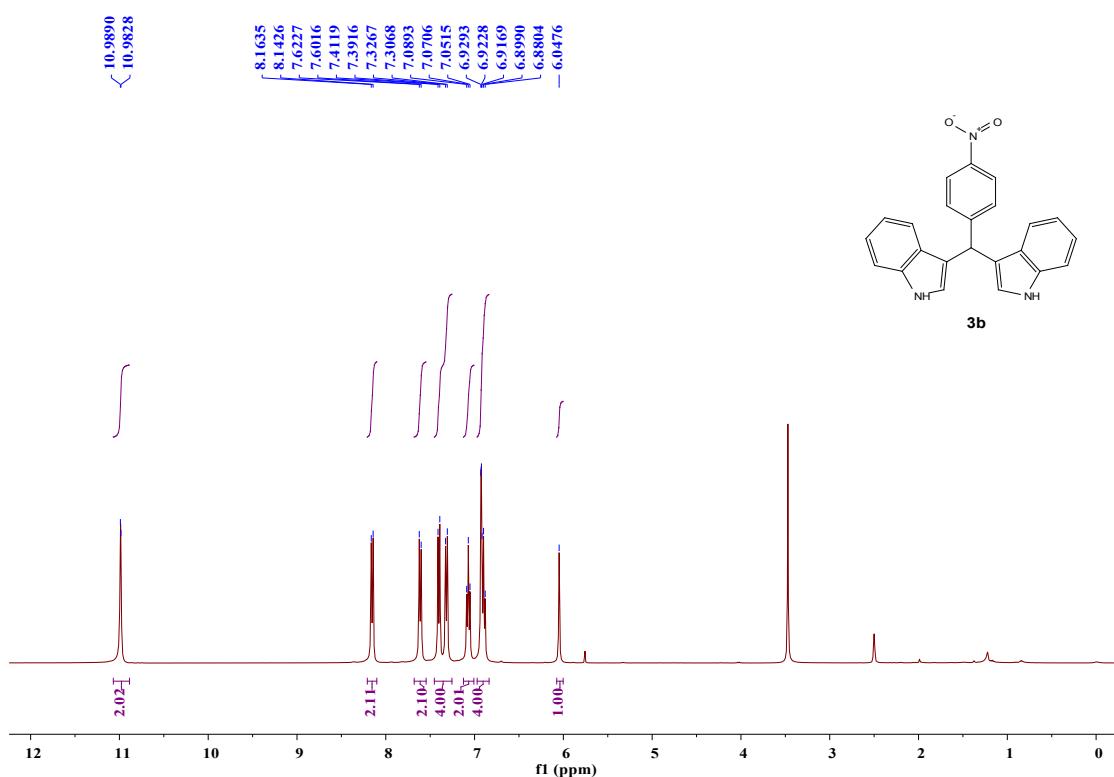

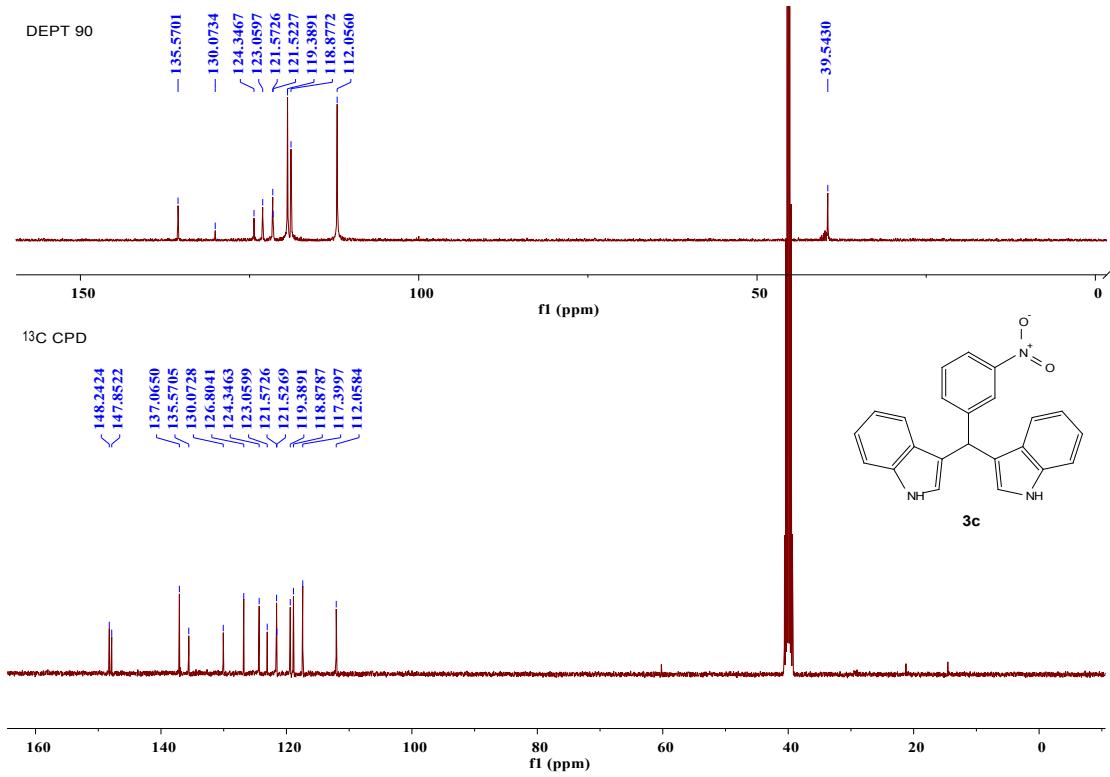

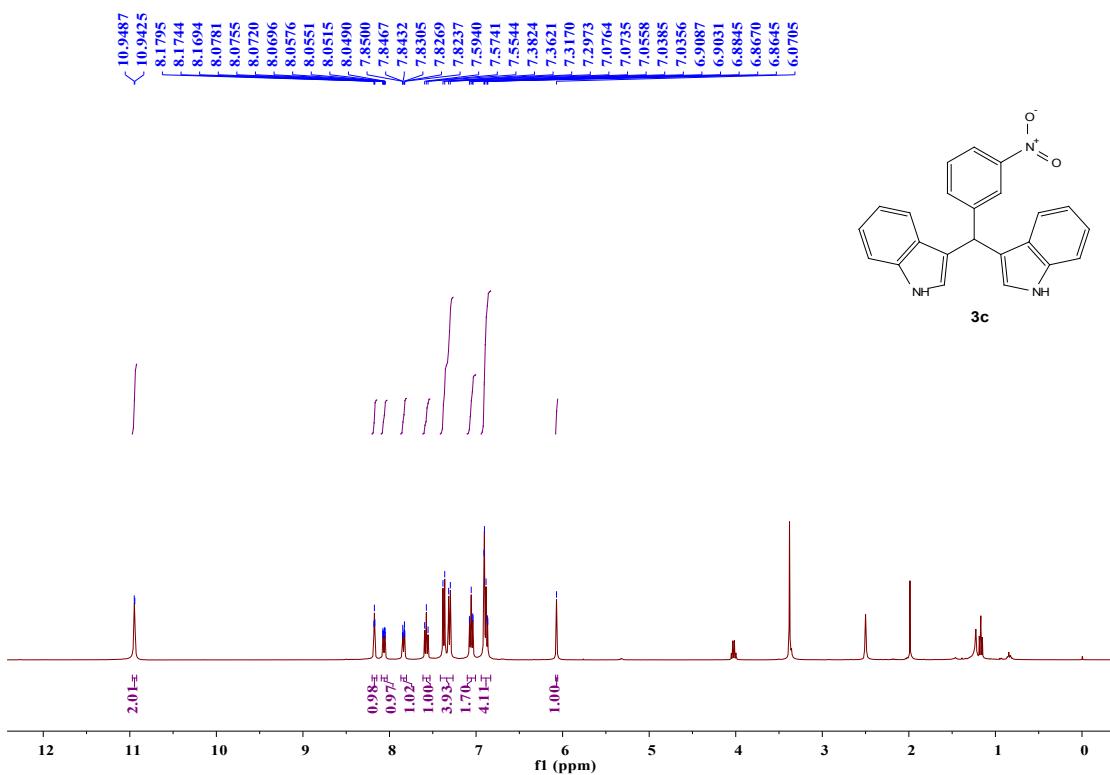

**2,2'-(4-nitrophenyl)methylenebis(3-methyl-1H-indole) (5a)**

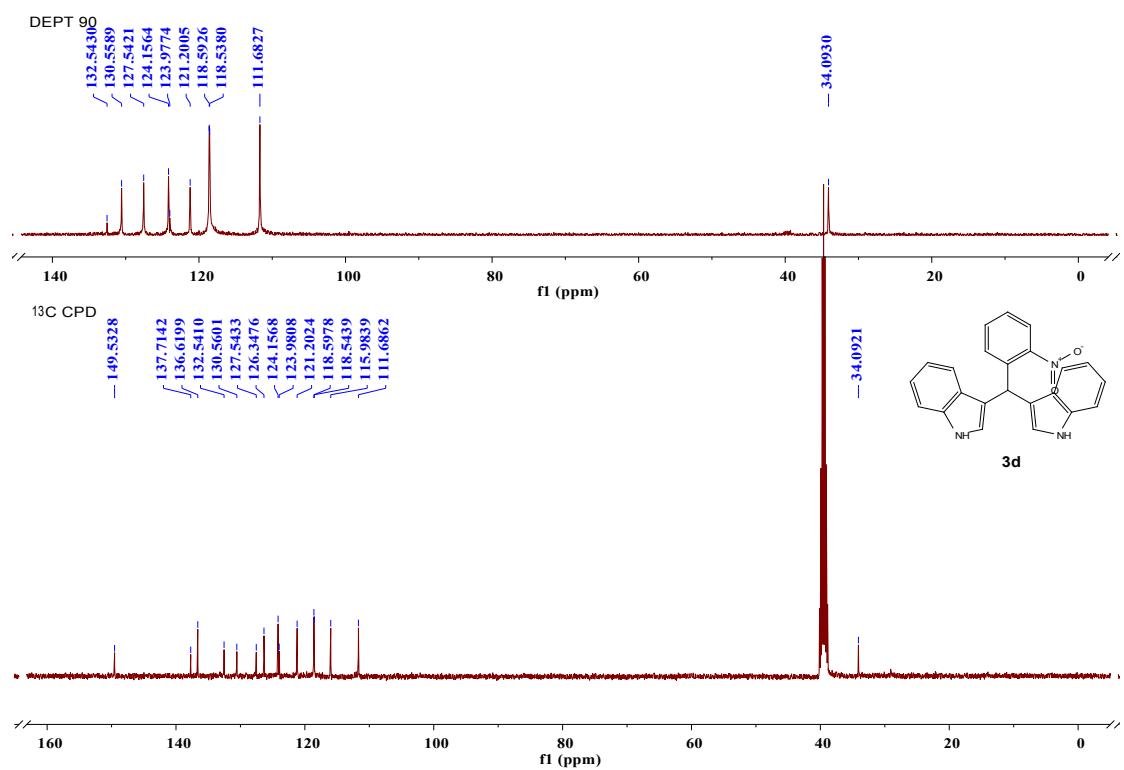

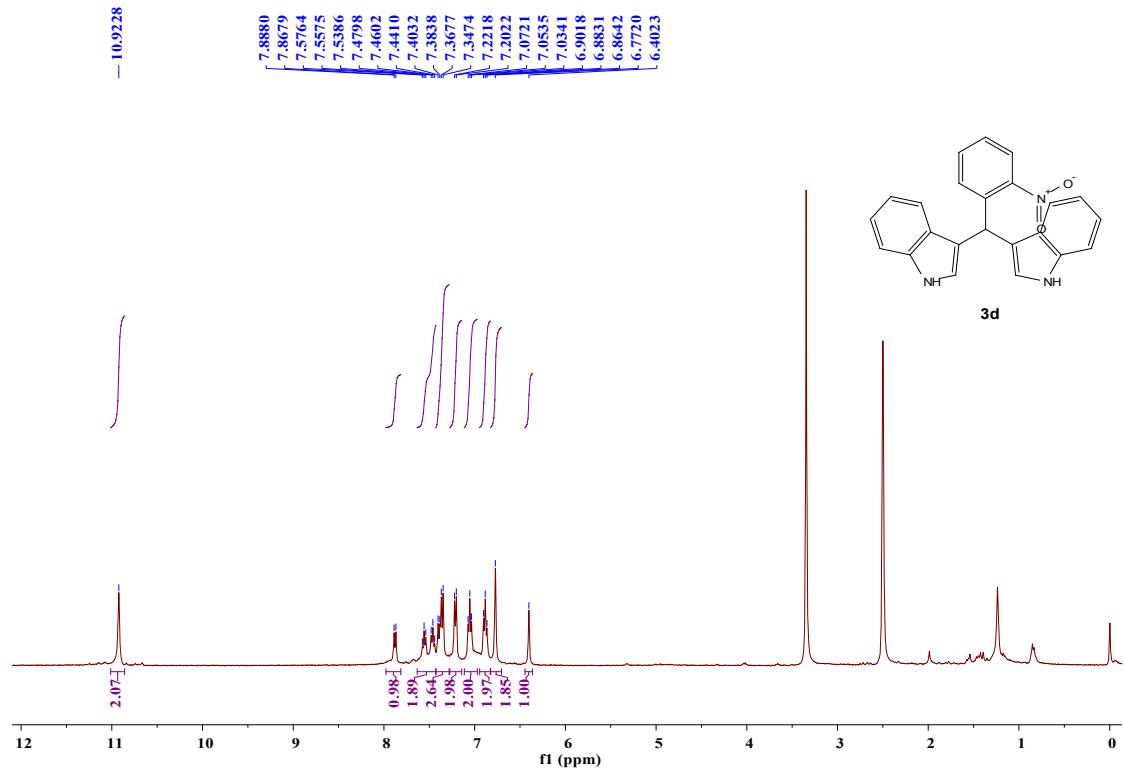

Yellow solid (60%); **<sup>1</sup>H NMR** (400 MHz, DMSO-*d*<sub>6</sub>)  $\delta$  10.50 (d, *J* = 6.1 Hz, 2H), 8.33 – 8.18 (m, 2H), 7.45 (dt, *J* = 13.9, 6.8 Hz, 4H), 7.32 (t, *J* = 7.2 Hz, 2H), 7.02 (dq, *J* = 26.6, 6.7, 5.4 Hz, 4H), 6.24 (d, *J* = 5.9 Hz, 1H), 2.17 (d, *J* = 6.1 Hz, 6H). **<sup>13</sup>C NMR** (100 MHz, DMSO-*d*<sub>6</sub>)  $\delta$  149.1, 146.3, 135.7, 133.1, 129.7, 128.5, 123.7, 121.0, 118.4, 118.0, 111.2, 107.3, 40.1, 8.5. **IR** (thin film)  $\nu_{\text{max}}$  3395.9; 2919.9; 2878.2; 1646.4; 1613.6; 1554.1; 1458.7; 742.4.
