1. General

Commercial reagents and solvents were obtained from the commercial providers and used without further purification. The products were purified using a commercial flash chromatography system or a regular glass column. TLC was developed on silica gel 60 F254 glass plates. ^1H NMR (600 MHz), ^{13}C NMR (150 MHz) and ^{19}F NMR (565 MHz) spectra were recorded on a Bruker NMR apparatus. The chemical shifts are reported in δ (ppm) values (^1H and ^{13}C NMR relative to CHCl_3 , δ 7.26 ppm for ^1H NMR and δ 77.0 ppm for ^{13}C NMR). Or alternatively, ^1H NMR chemical shifts were referenced to tetramethylsilane signal (0 ppm). Multiplicities are recorded by s (singlet), d (doublet), t (triplet), q (quartet), p (pentet), h (hextet), m (multiplet) and br (broad). Coupling constants (J), are reported in Hertz (Hz). Commercial reagents were used without any further purification.

2. General procedures for the synthesis of starting material

2.1 Preparation of azido alkenes²

The azido alkenes **2** were prepared from the corresponding alkenes in the presence of IN_3 by the known procedure.² To a stirred solution of ICl (2.2 mmol) in MeCN (4 mL) was added NaN_3 (4 mmol) at rt, 1.5 h later, the reaction mixture was cooled to 0 °C, a solution of alkene (2 mmol) in MeCN (4 mL) was added. After 5 h later, the mixture was partitioned between ether and H_2O , the organic phase was separated, dried over Na_2SO_4 and concentrated. The crude reaction mixture was dissolved in Et_2O (6 mL), then KO^tBu (3.1 mmol) was added. The reaction mixture was stirred for 5 h at rt, then partitioned between ethyl acetate and H_2O , the organic phase was separated, dried over Na_2SO_4 and concentrated. The residue was chromatographed to afford the azido alkene **1**.

Because organo azides are generally considered as unstable compounds, we conducted the thermogravimetry (TGA) and differential scanning calorimetry (DSC) of several the vinyl azide substrates (Figure S1). Vinyl azide substrates tended to decompose at above 90 °C. Therefore, the storage of **1** in a freezer is recommended. In our cases, **1** could be stored in a freezer (-20 °C) without detectable decomposition for several months. According to an early report on kinetics of thermolysis of vinyl azides (*J. Org. Chem.*, **1986**, 3176), thermolysis of vinyl azides gives 1-azirine as the product. For thermolysis of vinyl azide **1a**, $\Delta\text{H} = 26.8 \text{ kcal/mol}$, $\Delta\text{G} = 27.3 \text{ kcal/mol}$, the thermolysis process is an endothermic process.

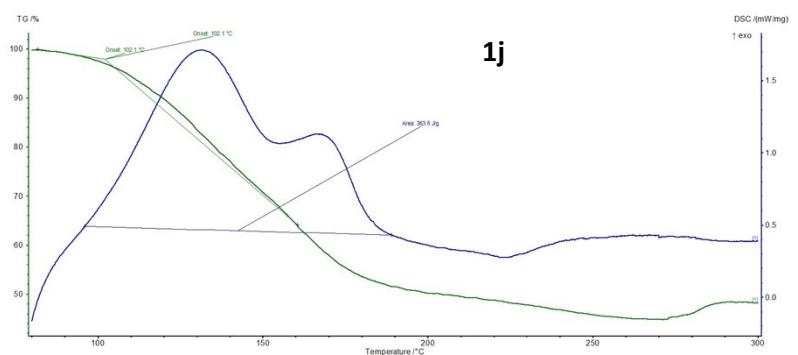

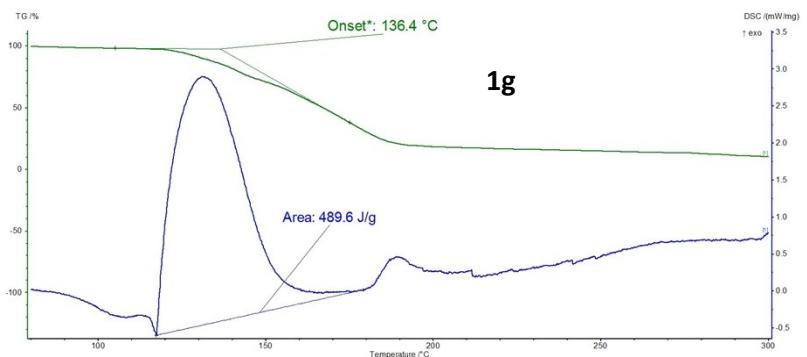

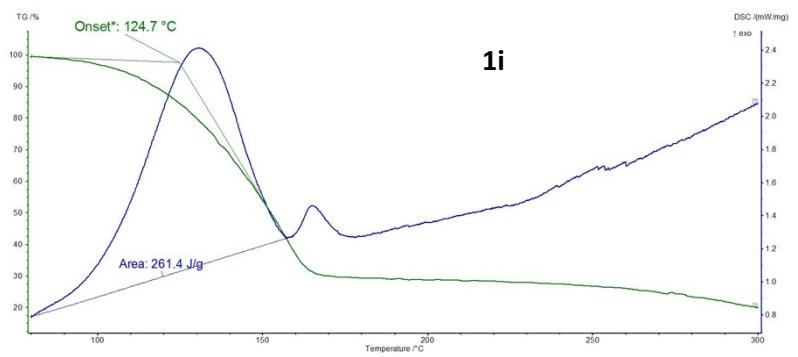

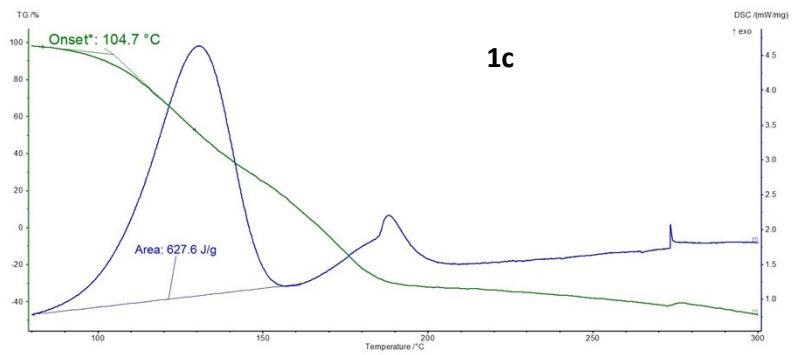

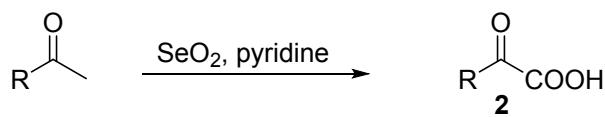

Figure S1. TGA-DSC of vinyl azides **1**.

2.2 Preparation of α -oxocarboxylic acids 2¹.

α -Oxocarboxylic acids **1** were prepared using a literature procedure (the oxidation of corresponding methyl ketones with SeO_2).¹ Methyl ketone (5 mmol), SeO_2 (6 mmol), 20 mL of pyridine were added to a 50 mL round-bottom flask. The reaction mixture stirred at 110 °C for 1 h, then 90 °C for 4 h. the desired product were isolated by silica-gel column chromatography.

4. General procedure for electrochemical synthesis of enaminones 3.

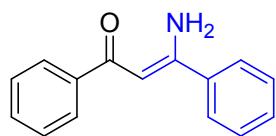

An undivided cell was equipped with a graphite felt ($1 \times 1 \text{ cm}^2$) and a platinum plate ($1 \times 1 \text{ cm}^2$) and connected to a DC regulated power supply. To the cell was added azido alkene **1** (0.2 mmol), *n*-Bu₄NI (0.01 mmol) and 2 mL of

0.1 M LiClO₄/(CH3CN:H2O = 10:1), α -oxocarboxylic acid **2a** (60.00 mg, 0.4 mmol) were added. The mixture was electrolyzed using constant current conditions (~ 3 mA/cm²) at 40 °C under magnetic stirring. When TLC analysis indicated that the electrolysis was complete (witnessed by the disappearance of the **2a**), the solvent was removed under reduced pressure. The residue was poured into a saturated aqueous solution of Na₂S₂O₃ and the product was then extracted with DCM (3×20 mL), dried over Na₂SO₄, and concentrated in vacuo. The residue was purified by column chromatography on silica gel using a mixture of petroleum ether/EtOAc (v : v = 5 : 1) as eluent to afford the desired pure product **3a**.

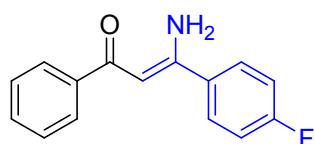

The graphite felt anode and Pt cathode could be reused for multiple times with similar chemical yields of **3a** after washed with water and acetone. The following is the the GC-yields of **3a** after each reuse of cathodes.
