Contents

Table S1. Operating conditions and measurement parameters for the conventional SN-ICPMS analysis.

Table S2. Relative signal intensities (mean $\pm$ SD, n=5) of analytes in multi-element standard solutions with different ethanol concentrations (0%, 1%, 10% and 20% (v/v), respectively).

Table S3. Relative signal intensities (mean $\pm$ SD, n=5) of analytes in wine samples with different dilution factors (1, 1.25, 2, 2.5, and 5).

Table S4. Quantitative results calibrated by three different external standards

Table S5. Calculated t-values (t) for the comparison of elements concentrations obtained in wine samples by LA-ICPMS and conventional SN-ICPMS.

Table S6. Determined concentrations (mean $\pm$ SD) of 20 elements in two additional wine samples by LA-ICP-MS.

Fig. S1 Time-resolved signals of $^{13}\text{C}^+$, $^{40}\text{Ar}^{13}\text{C}^+$ and $^{12}\text{C}^{13}\text{C}^+ + ^{12}\text{C}^{12}\text{C}^1\text{H}^+$ in the LA-ICPMS analysis of a blank solution containing 10% (v/v) ethanol.

Fig. S2 Limits of detection (LOD) for 20 elements analyzed by LA-ICPMS in samples of liquid and solid states.

Fig. S3. Dendrogram for the cluster analysis of 20 elemental concentrations in six wine samples from four counties (Spain, China, Chile, France).

Table S1. Operating conditions and measurement parameters for the conventional SN-ICPMS analysis.

ICP-MS (Agilent 7700x)	
RF power	1400 W
Plasma gas flow rate	15.0 L min ⁻¹
Auxiliary gas flow rate	1.0 L min ⁻¹
Carrier gas flow rate	0.75 L min ⁻¹
Makeup gas flow rate	0.30 L min ⁻¹
Sampling depth	14.0 mm
Sample uptake rates	100 µL min ⁻¹
Integration time	0.3 s
Spray chamber	Scott double-pass type
Spray chamber temperature	2 °C

Table S2. Relative signal intensities (mean $\pm$ SD, n=5) of analytes in multi-element standard solutions with different ethanol concentrations (0%, 1%, 10% and 20% (v/v), respectively). The data were collected on two different days and analyzed under the same conditions cited in Table 1.

Analyte	Ethanol concentration (v/v)							
	Day 1				Day 2

La	0.163	1.592	1.164	0.028
Ce	0.446	0.364	1.417	0.249
Pr	0.300	0.411	0.014	1.074
Nd	0.780	0.150	0.190	1.621
Pb	0.593	1.339	0.033	0.580
U	0.083	1.182	0.588	1.572

* The critical t-value for 11 degrees of freedom and 95% confidence level: 2.201.

Equations employed to calculate t-values (t):

$$t = \frac{\bar{X}_1 - \bar{X}_2}{\sqrt{\frac{S_p^2}{n_1} + \frac{S_p^2}{n_2}}}$$

$$S_p^2 = \frac{(n_1 - 1)S_1^2 + (n_2 - 1)S_2^2}{n_1 + n_2 - 2}$$

For degree of freedom (df): $n_1=10$, $n_2=3$, $df=n_1+n_2-2$.

* Since we obtained t-values lower than the critical t-value for 11 degrees of freedom (i.e., $t < 2.201$), so we conclude that the differences of in the average concentrations obtained with between these two methods were is statistically insignificant at a 95% confidence level.

Table S6. Determined concentrations (mean $\pm$ SD, ng mL⁻¹, except for B and Mg concentration) of 20 elements in two additional wine samples by LA-ICP-MS.

Element	W5-China (ng mL ⁻¹)	W6-Chile (ng mL ⁻¹)
	LA-ICP-MS (n = 10)	SN-ICP-MS (n = 10)
