**Table S2. Model Components.** The first 27 components of the model are protein groups. This is followed by 5 iron nonprotein groups and 8 noniron nonprotein groups for a total of 40 components. There are also 3 nutrients and 2 waste products. The prefix ‘a’ on protein groups (e.g. aFET3) means the apo form of the group. The double prefix ‘aa’ indicates an apo protein (e.g. aaCIA) that is metallated in two reactions, affording an intermediate form (aCIA) in which one type of iron center was inserted and the other was not. Subscripts ‘st’ and ‘tr’ mean stationary and transient, respectively. No stoichiometry is suggested for these reactions; substrates, catalysts, and products are indicated but not quantified. The list of reactions is incomplete but serves to illustrate the types of reactions involved.
