**Figure S.1. DLS histograms of hydrodynamic diameters**

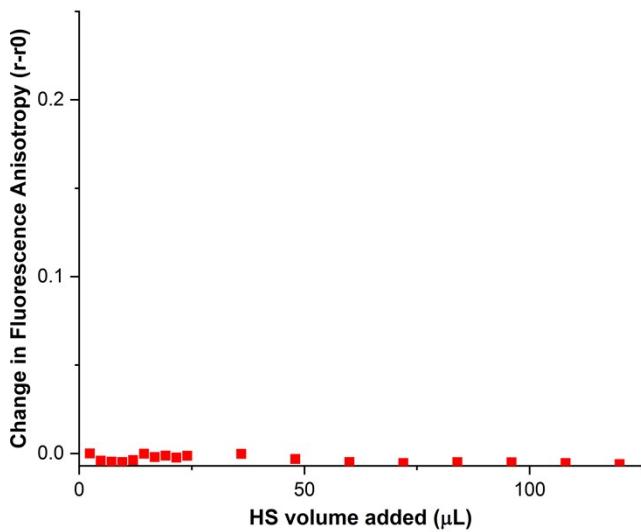

**Figure S.2. Fluorescence anisotropy control titrations**

**Figure S.2.a.** Binding profiles for GF Peptide-NP reactions incubated for 0 min and 60 min. Longer incubation times result in smoother and more reproducible curves with improved fit parameters. RSS is the residual sum of squares for the regression analysis of the data.

**Figure S.2.b.** GF Peptide titrated with increasing volumes of 1:500 human serum (HS) does not result in binding interactions characteristic of a target-ligand binding curve. These results validate that the GF Peptide-NP binding curves obtained in the presence of HS are due to Peptide-NP interactions only.

**Table S.1. Parameters from Langmuir adsorption isotherm fits (full titration curves in Figure 4).** Fit parameters on the top section are for assays in buffer, while the shaded, bottom section includes parameters from solutions containing 1:500 HS. Each curve was generated from n=4 measurements, RSD values are an average for all the points in each curve. The pH 7.4 and 0.29 mM NaCl solutions with HS (greyed column 3 & 6) are identical in composition (see details in experimental section), therefore averaged binding profiles and parameters reported are the same for both conditions. Thus, the parameters for the samples in 0.29 mM NaCl with HS were omitted from the table for clarity.

		pH 7.4	pH 7.2	pH 7.6	0.29 mM NaCl	29 mM NaCl	0.5 M Glucose	1.0 M Glucose

**Table S.2. ANOVA Analysis**

**Homoscedasticity and Normality.** Significant p-values marked with (\*). Analysis conducted with samples n=3 or n=4 for each condition. Hydrodynamic diameter, Kd, and max data were log transformed for the statistical analysis.

Data	Levene's Test (Homoscedasticity)			Shapiro-Wilke's Test (Normality)	
	Df (group, residual)	F-statistic	P-value	W-statistic	P-value
K <sub>d</sub>	5, 47	2.7095	0.03125*	0.43461	<0.001*
max	5, 47	3.5561	0.008277*	0.65237	<0.001*
hydrodynamic diameter	6, 20	0.577	0.7442	0.96058	0.3809
zeta Potential	13, 28	0.4453	0.9369	0.97258	0.4016

**Dissociation constant (Kd) : 2-Way ANOVA and Tukey Test.** Significant p-values marked with (\*). Analysis conducted with samples n=3 or n=4 for each condition. Data was log transformed for the analysis.
