**Table S1** Molecular weight and PDI of lignin samples

Lignin samples	M <sub>n</sub> (g/mol)	M <sub>w</sub> (g/mol)	PDI
AL	2779	6768	2.44

▲ XRD data analysis was based on the following Bragg Equation and Scherrer Equation:

$$d_{002}(\text{nm}) = \frac{\lambda}{2\sin\theta} \quad (\text{Equation S1})$$

$$L_c(\text{nm}) = \frac{k\lambda}{\beta_{002} \cos\theta} \quad (\text{Equation S2})$$

Where  $d_{002}$  is distance between two crystalline lattices,  $\theta$  is the Bragg angle,  $\lambda$  is wavelength of X-ray (0.1540598nm),  $L_c$  is graphite microcrystalline stacking thickness,  $k$  is the shape factor (set as 0.94),  $\beta_{002}$  is the full width at half maximum of diffraction peak (in radian).

The relative quantification of  $\beta$ -O-4,  $\beta$ - $\beta$ , or  $\beta$ -5 linkages and S/G ratio were calculated according to following formulas:

$$I(X)\% = \frac{I(X)}{0.5I(S_{2,6}) + I(G_2) + 0.5I(H_{2,6})} \times 100\% \quad (\text{Equation S3})$$

Where  $I(X)$  is the integration of  $\alpha$ -position of A( $\beta$ -O-4), B( $\beta$ - $\beta$ ), or C( $\beta$ -5) linkages, and the integration of  $B_\alpha$  needs to be divided by 2 because there are two  $\alpha$ -positions in B structures.  $I(S_{2,6})$  is the integration of  $S_{2,6}$ , including S and S'.  $I(G_2)$  is the integration of  $G_2$ .  $I(H_{2,6})$  is the integration of  $H_{2,6}$ . The integration should be in the same contour level.

$$S/G = 0.5I(S_{2,6})/I(G_2) \quad (\text{Equation S4})$$

Where  $I(S_{2,6})$  is the integration of  $S_{2,6}$ , and  $I(G_2)$  is the integration of  $G_2$ .
