**Table S1** BET surface area, pore volume and pore size of the different samples

Sample	$S_{BET} (\text{m}^2 \cdot \text{g}^{-1})$	Pore volume ( $\text{cm}^3 \cdot \text{g}^{-1}$ )	Pore size (nm)
Mo <sub>2</sub> C@N-CANs (freeze drying)	239.73	0.2514	3.93

**Table S2** ICP result of the Mo<sub>2</sub>C@N-CANs samples

Sample	Mo (mg/L)	The load of Mo <sub>2</sub> C calculated on the N-CANs
Mo <sub>2</sub> C@N-CANs	557	50.8%

The method of ICP test: 0.035g of Mo<sub>2</sub>C@N-CANs was dissolved in 3 mL of aqua regia under sonication for 30 min. Then, the solution was diluted to 30 mL and centrifuged under 8000 rmp. The supernatant was used for ICP test. The load of Mo<sub>2</sub>C on N-CANs could be calculated by the measured concentration of Mo element by the following formula:

$$\text{The load of Mo}_2\text{C on N-CANs} = (C_{\text{Mo}} \times 30) / (M_{\text{Mo/Mo}_2\text{C}} / M_{\text{Mo}_2\text{C}}) / 35 \times 100\%$$

where  $C_{\text{Mo}}$  is the concentration of Mo tested by ICP, 30 is the total volume of the solution,  $M_{\text{Mo/Mo}_2\text{C}}$  is the relative molecular weight of Mo in Mo<sub>2</sub>C, which is 191.88,  $M_{\text{Mo}_2\text{C}}$  is the relative molecular weight of Mo<sub>2</sub>C molecular, which is 203.88 and 35 mg is the total quality of the weighed Mo<sub>2</sub>C@N-CANs.
