General Information

Optical rotations were measured with a Perkin–Elmer 341 polarimeter at 589 nm. . ¹H and ¹³C NMR spectra were recorded BRUKER DRX-300 AVANCE spectrometer (at 300.13 MHz for Protons and 75.47 MHz for Carbon-13) and BRUKER DRX-400 AVANCE spectrometer (at 400.4 MHz for protons and 100.7 MHz for Carbon-13). IR spectra were recorded on a Bomen FT-IR-MB-series instrument. Enantiomeric excess (ee) of compound 7b and 9 were determined by HPLC analysis using a Daicel Chiralpak AD-H column. All reagents and starting materials were purchased from Aldrich, Merck, and Fluka. All solvents were reagent grade and were dried and distilled immediately before use as follows: methanol and ethanol from mg/I₂, methylene chloride from calcium hydride. Column chromatography was performed using silica gel 60 (230–400 mesh) eluting with ethyl acetate/n-hexane. TLC was performed using silica gel 60 F256 plates with visualization by UV.

Computational details

In this work, all geometries of the reactant (Re), transition states (TS) and products (Pr) have been fully optimized using B3LYP/6-31G(d,p) in gas phase at 298.15 K. Geometries of transition states have been verified to be correct structures by observation of a single imaginary frequency and intrinsic reaction coordinate (IRC) calculations.. The electronic structures and Frontier orbital contributions are calculated by the natural bond orbital (NBO) method. Non-covalent interactions (NCI) have been plotted with using Multiwfn (version 3.3.8). All of the other calculations were carried out using the Gaussian 09 program. The optimized structures were shown using the CYLView software. Electronic chemical potential μ , chemical hardness η , global nucleophilicity N , global electrophilicity ω , softness S, Synchronicity Sy and Local Fukui functions were calculated based on the following formulas:

$$1) \quad \mu = (\varepsilon_{\text{HOMO}} + \varepsilon_{\text{LUMO}})/2$$

$$2) \quad \eta = \varepsilon_{\text{LUMO}} - \varepsilon_{\text{HOMO}}$$

$$3) \quad N = \varepsilon_{\text{HOMO}} - \varepsilon_{\text{HOMO(TCE)}}$$

$$4) \quad \omega = (\mu^2/2\eta)$$

$$5) \quad S = 1/(2\eta)$$

$$6) \quad Sy = 1 - (2n - 2)^{-1} \sum_{i=1}^n \frac{|\delta B_i - \delta B_{av}|}{\delta B_{av}}, \quad \delta B_i = \frac{B_i^{TS} - B_i^R}{B_i^P - B_i^R}, \quad \delta B_{av} = n^{-1} \sum_{i=1}^n \delta B_i$$

Here, n and δB_i correspond to the number of bonds directly involved in the reaction and the relative variation of the Wiberg bond indices.

$$7) \quad f_k^+ = q_k^N - q_{k'}^{N+1}$$

$$8) \quad f_k^- = q_{k'}^{N-1} - q_k^N$$

Where k , N and q , correspond to the index of the atom, the number of electrons and the net charge, respectively.
