1. Computational details

All DFT calculations were conducted with the Gaussian 09 software package.¹ Geometry optimizations of all the minima and transition states were performed using B3LYP^{2,3} functional with 6-31G(d) basis set, including solvation energy corrections and Grimme's D3 empirical dispersion corrections with BJ-damping.^{4,5} To confirm whether each optimized stationary point is an energy minimum or a transition state, as well as evaluate the zero-point vibrational energy and thermal corrections at 298 K, the vibrational frequencies were computed at the same level of theory as for the geometry optimizations. The solvation energies of dichloromethane were evaluated by a self-consistent reaction field (SCRF) using the SMD model.⁶ For critical transition states, IRC (intrinsic reaction coordinates) analysis was also performed at the same level of theory as geometry optimization to verify the proposed process. The single-point energies were computed with B3LYP functional and 6-311+G(d,p) basis set, with solvation energy corrections and Grimme's D3(BJ) dispersion corrections as well. Extensive conformational searches for the intermediates and transition states have been conducted to ensure that the lowest energy conformers were located. The 3D diagrams of molecules were generated using CYLView.⁷

It is worth pointing out that **TS25** is a second order saddle point, which involves a small imaginary frequency of phenyl ring rotation. All the attempts for the first order saddle point location led to this second order saddle point **TS25**.

2. IRC calculations of the transition states in Fig. 1.

The results of IRC calculations of **TS2**, **TS4** and **TS8** are included in Fig. S1-S3. The IRC calculation of the C-C bond formation transition state **TS6** was not successful despite extensive efforts, which could be related to the flat free energy surface around **TS6**. (Pre: preceding intermediate, TS: transition state, Post: post intermediate).

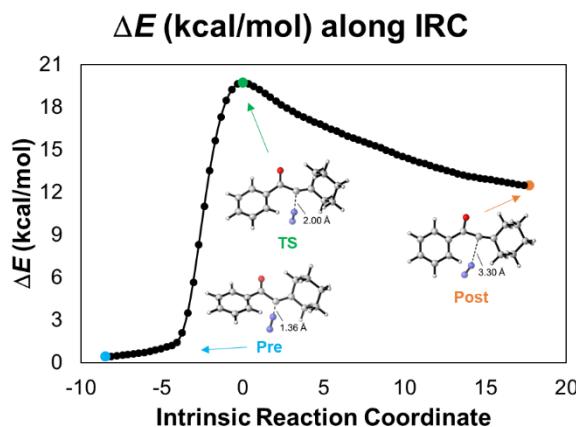

Fig. S1. IRC calculation of **TS2**.

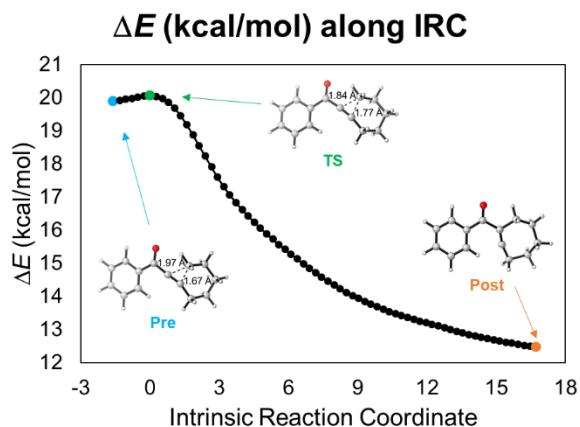

Fig. S2. IRC calculation of **TS4**.

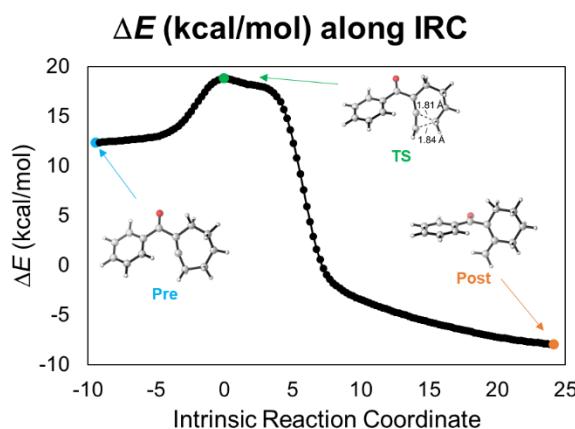

Fig. S3. IRC calculation of TS8.

3. DFT-computed free energy profile of intramolecular arene C-H vinylation by vinyl cation with *para*-nitro substitution.

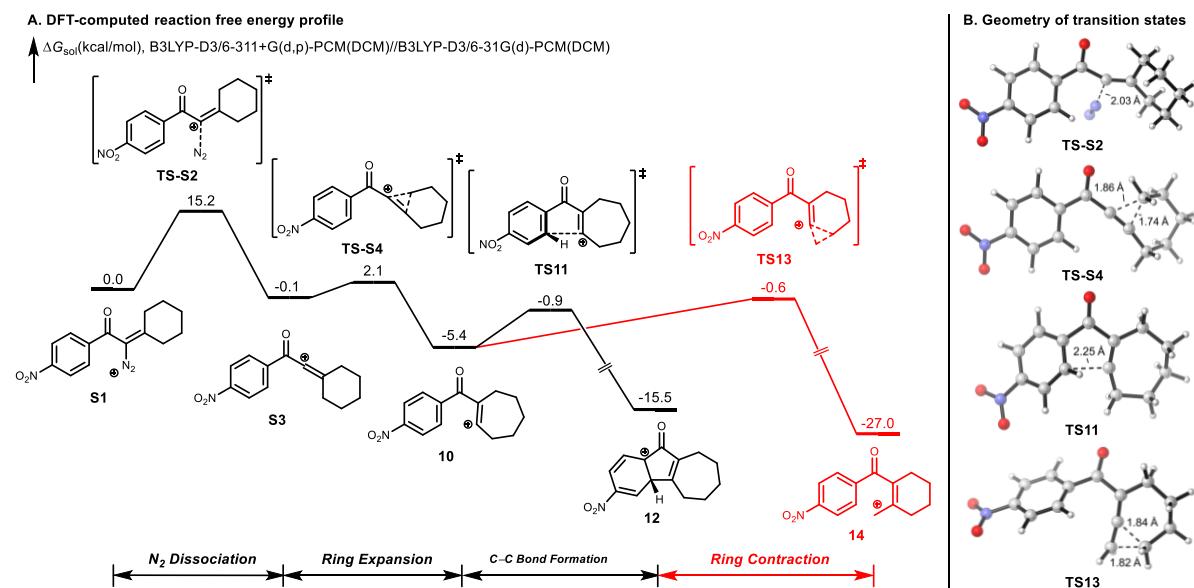

Fig. S4. DFT-calculated reaction energy profile of intramolecular arene C-H vinylation by vinyl cation with *para*-nitro substitution.

4. DFT-computed free energy profile of intramolecular arene C-H vinylation by vinyl cation with cyclopentane moiety.

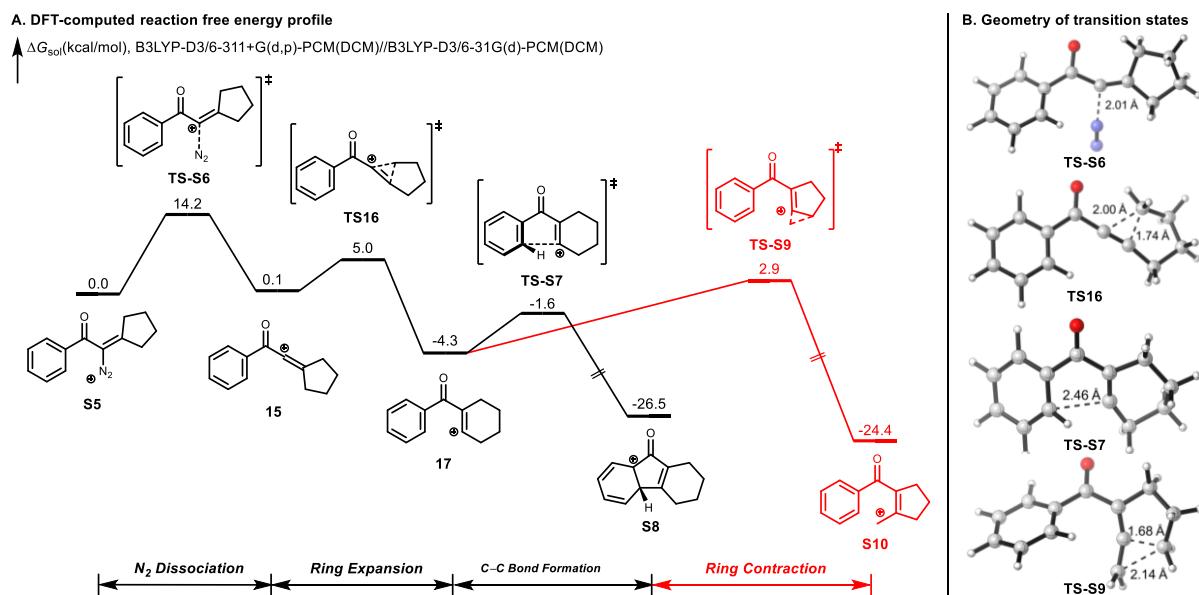

Fig. S5. DFT-calculated reaction energy profile of intramolecular arene C-H vinylation by vinyl cation with cyclopentane moiety.

5. IRC calculation of the transition states in Fig. 2.

The results of IRC calculations of **TS19**, **TS23**, **TS25** and **TS29** are included in **Fig. S6-S8**, and **S10**. The IRC calculation of the benzyl rotation transition state **TS27** was not successful despite extensive efforts, which could be related to the flat free energy surface around **TS27**. We performed energy scan of the benzyl rotation of intermediate **26**, to confirm that the benzyl rotation leads to the C-C bond formation in spiro intermediate **28** (**Fig. S9**). (Pre: preceding intermediate, TS: transition state, Post: post intermediate)
