1. General methods

All the chemicals were purchased from commercial sources and used without further purification. Reactions were performed in oven-dried sealed tubes and the reactions were conducted under a nitrogen atmosphere. Glass syringes were used to transfer solvents. Crude products were purified by column chromatography on silica gel of 60–120 or 100-200 mesh. Melting points (**MP**) were obtained on Buchi B-540. ¹**H** and ¹³**C** **NMR** (proton-decoupled) spectra were recorded in CDCl₃ solvent on 300, 400 or 500 MHz NMR spectrometer. Chemical shifts (δ) were reported in parts per million (ppm) with respect to TMS as an internal standard. Coupling constants (J) are quoted in hertz (Hz). Mass spectra and HRMS were recorded on mass

spectrometry by Electrospray ionization (ESI) or Atmospheric pressure chemical ionization (APCI) technique.
