Supplementary table 1

Supplementary table 1: Results of Photodynamic Decontamination of *R. fascians*, *X. axonopodis* and *E. amylovora* using different PSs. PDI was done at three different concentrations (1 μ M, 10 μ M, 100 μ M) of Chlorophyllin, Chlorophyllin with 5 mM Na2EDTA, Chlorophyllin with 1.2 % Baypure®DS100 and B17 0024 using a 395 nm LED-array (radiant fluence 26.6 J cm $^{-2}$, irradiance 14.8 mW cm $^{-2}$). Counting of CFU took place 24 h after illumination for *E. amylovora* and 48 h after illumination for *X. axonopodis* and *R. fascians*. The mean value and the standard deviation were calculated from at least three biological independent replicates. Three controls were included in this experiment. Co -/-: double negative control; PS only: dark control; light only: light control.
