## 5. X-ray crystallographic analysis data of BF<sub>2</sub> complexes.

Crystallographic data of the studied Ar@HCs are listed in Tables S 11-14. We were unable to prepare single crystals of **Ph@Q** and **3-Phen@Py** for X-ray analysis. The X-ray crystal structure was solved by direct methods (Sir2011)<sup>2</sup> and refined by full-matrix least-squares analysis (SHELXL-2013),<sup>3</sup> using an isotropic extinction correction. All non-hydrogen atoms were refined anisotropically; hydrogen atoms were refined isotropically, whereby hydrogen positions are based on stereochemical considerations.

We were unable to prepare single crystals of **Ph@Q** and **3-Phen@Py** for X-ray analysis.

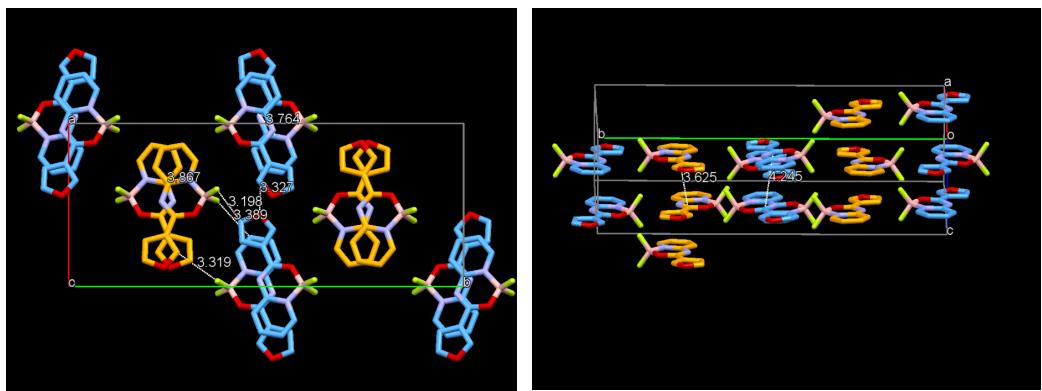

X-ray structures and crystal packing of studied compounds except for **1-Np@Py**, **3-T@Py**, **Ph@Q**, **1-Phen@Py** and **3-Phen@Py** are shown below in Figures S23-27.

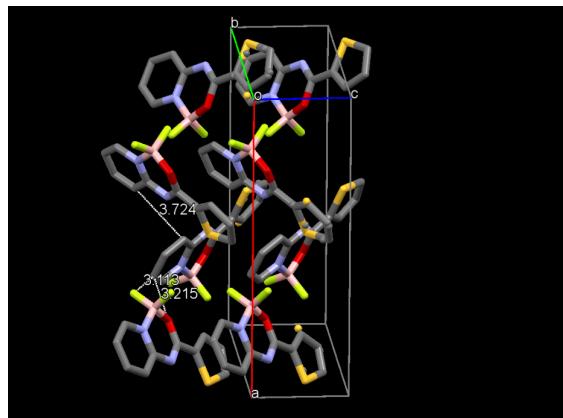

**Figure S23.** In the crystal of **2-Np@Py**, the molecule is stacked to form a dimeric head-to tail structure in an anti-fashion along with the *a*-axis. The face-to-face distance the molecules in the column was 3.49 Å. No full-overlap between the naphthyl and  $\text{BF}_2$  moieties was observed. The fluorine atoms at  $\text{BF}_2$  unit were interacted with the hydrogen atoms of furan, pyridine and naphthyl rings.

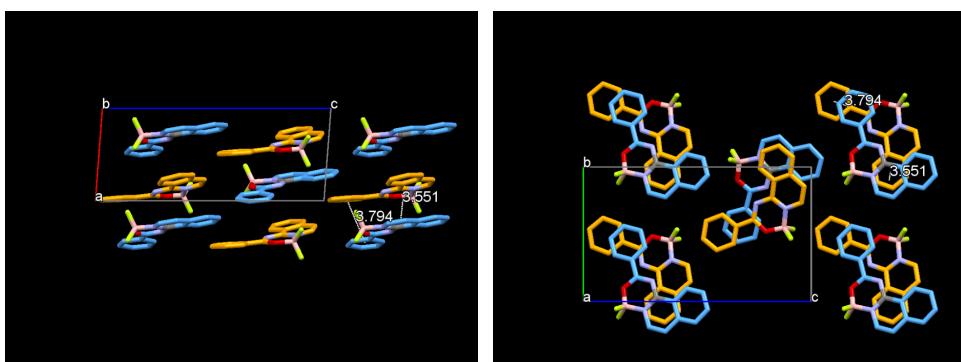

**Figure S24.** In the crystal of **2-F@Py**, the molecule is stacked along the *a*-axis to form dimeric head-to-tail structure. The center-to-center distance between the furan and pyridine rings was 3.52 Å. The fluorine atoms at  $\text{BF}_2$  unit were interacted with the hydrogen atoms of furan and pyridine rings at the neighboring column in the distances of 3.21-3.23 Å.

**Figure S25.** Two-type coordinates were seen in the single crystal of **3-F@Py** depending on the dihedral angles between the furan and  $\text{BF}_2$  rings, which were  $4.33^\circ$  shown in blue color and  $1.33^\circ$  in yellow color. In the single crystalline of **3-F@Py**, the molecule is stacked to form two-type columns along the c-axis in anti, head-to-tail (blue) and anti, head-to-head forms (yellow). The centroid distances between the molecules were  $4.25 \text{ \AA}$  for the blue column (anti, head-to-tail type) and  $3.63 \text{ \AA}$  for the yellow one (anti, head-to-head).

**Figure S26.** The molecule **2-T@Py** adopted *syn-* and *anti-* configurations due to the orientation of the thiophene ring. In the crystal, a disorder was observed in a ratio of 15: 85 (*syn* to *anti*). A slipped-stack column was seen along the c-axis. The face-to-face distance between the  $\text{BF}_2$  moieties was  $3.47 \text{ \AA}$ . The neighbored columns are interacted between F and H atoms of the corresponding  $\text{BF}_2$  unit and the pyridine ring, respectively.

**Figure S27.** Two-type coordinates were seen in the single crystal of **Ph@IQ** depending on the dihedral angles between the neighbored **Ph@IQ** molecules, which were  $4.68^\circ$  shown in blue color and  $6.37^\circ$  in yellow color. The blue- and yellow-colored molecules are mutually stacked in anti, head-to-head form along the a-axis. The distances between the isoquinolines moieties was  $3.79 \text{ \AA}$  whereas that between the phenyl rings was  $3.55 \text{ \AA}$ .
