Contents of the electronic supplementary document:

1. Monomer **3** Nuclear Magnetic Resonance Characterization
 - S1 ^1H -NMR
 - S2 ^{13}C -NMR
 - S3 ^1H - ^{13}C HMBC
 - S4 COSY
2. Monomer **5** Nuclear Magnetic Resonance Characterization
 - S5 ^1H -NMR
 - S6 ^{13}C -NMR
 - S7 ^1H - ^{13}C HMBC
 - S8 COSY
3. Monomer **7** Nuclear Magnetic Resonance Characterization
 - S9 ^1H -NMR
 - S10 ^{13}C -NMR
 - S11 ^1H - ^{13}C HMBC
 - S12 COSY
4. Monomer **9** Nuclear Magnetic Resonance Characterization
 - S13 ^1H -NMR
 - S14 ^{13}C -NMR
 - S15 ^1H - ^{13}C HMBC
 - S16 COSY
5. Photopolymerization Kinetics via Real-time FTIR
 - S17 Real-time FTIR – alkene and thiol conversion versus time for monomers 3, 5, 7, and 9.
6. Degradation product analysis of **P9** Thermoset
 - S18 ^1H -NMR of multi-functional alcohol by-product from acidic degradation
 - S19 ^1H -NMR of ketone by-product from acidic degradation
 - S20 ^1H -NMR spectrum of basic degradation by-products
7. Video of thermoset degradation in 1M HCl.

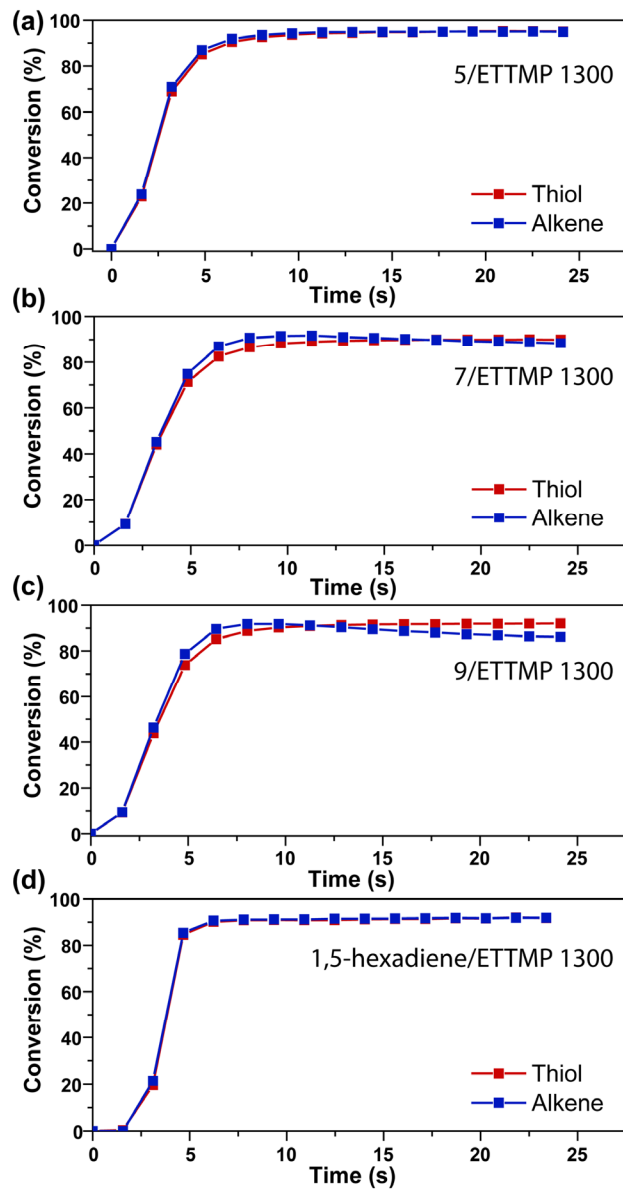

Fig. S17. Experiments resulted in respectable conversions of 94%, 95%, and 92% for thermosets 1a, 1b (a) and 1,5-hexadiene (d) respectively, while compositions based on 1c and 1d showed conversions of 91% (b,c).

Acidic degradation product analysis for P9

Experimental procedure: 900mg of P9 was degraded in 20 mL HCl/H₂O (pH 0.2) over the course of 12 h. Fine white crystals formed in the degradation solution. The crystals were washed with DI H₂O and ethanol and set aside for analysis. The remaining degradation solution was extracted 2x with chloroform, dried with sodium sulfate and vacuumed to yield a clear viscous oil. The crystals and viscous oil products were analyzed by ¹H-NMR and were confirmed as 1,4-diacetylbenzene (fine white crystals) and a multifunctional alcohol (clear viscous oil). Both products confirmed ketal hydrolysis to be the main mechanism of degradation for P9.

Fig S18. ¹H-NMR spectrum of water-soluble P9 degradation by-products obtained under acidic conditions (pH 0.2).

Fig S19. ¹H-NMR spectrum of water-insoluble P9 degradation by-products obtained under acidic conditions (pH 0.2).

Basic degradation product analysis for P9

Experimental procedure: 900mg of P9 was degraded in 20 mL of NaOH/H₂O (pH 13.5) over 10 h. No precipitates or crystals were observed to form. The remaining degradation solution was neutralized with HCl/H₂O solution before being extracted 2x with chloroform, dried with sodium sulfate and vacuumed to yield a clear viscous oil. ¹H-NMR confirmed the products to be trimethylol propane ethoxylate and a carboxylic acid end-functionalized ketal crosslinker. Both products confirmed ester hydrolysis to be the main mechanism of degradation for P9.

Fig S20. ¹H-NMR spectrum of P9 degradation by-products obtained under basic conditions (pH 13.5).

Video S1. Degradation of poly(β -thioether ester ketal) thermosets P3, P5, P7, at pH 0.88 (HCl/H₂O). Full length video is 17h presented at approximately 1500x speed. Note: Thermoset disk size for video capture was based on 5 μ L droplets prior to photopolymerization. This disk size is much smaller than samples employed in mass loss experiments.
