## 1. Computational details

All theoretical calculations on the possible mechanisms of LBs catalyzed annulation reactions of allenolate with chalcone were performed using Gaussian 09 suite of programs. All structures of the stationary points were optimized by the M06-2X/6-31G(d, p)/def2-TZVP method in solvent using integral equation formalism polarizable continuum model (IEF-PCM) at 298.15 K. The solvent is acetonitrile for NHC/PMe<sub>3</sub> catalysis system and the solvent is toluene for DABCO catalysis system. Moreover, basis sets 6-31G(d, p) and 6-311++G(2d, 2p) were employed for H, C, N, O and P atoms, while basis sets def2-TZVP and def2-QZVP were used for Cs atom. The corresponding vibrational frequencies were calculated at the same level (M06-2X/6-31G(d, p)/def2-TZVP//IEFPCM) to take account of the free energy contributions. The single-point energies of the optimized structures were then refined at the higher basis set 6-311++G(2d, 2p)/def2-QZVP with the M06-2X method and the same solvent effect included and simulated by using IEF-PCM. We confirmed that all the reactants, intermediates, and products have no imaginary frequencies, whereas each transition state has only one imaginary frequency. In addition, we have also made some tests of the different computational methods (such as B3LYP, B3PW91, and  $\omega$ B97X-D).

## 2. The optimized structures of stationary points of the most favorable $[\alpha, \beta]$ -[4 + 2] annulation pathway

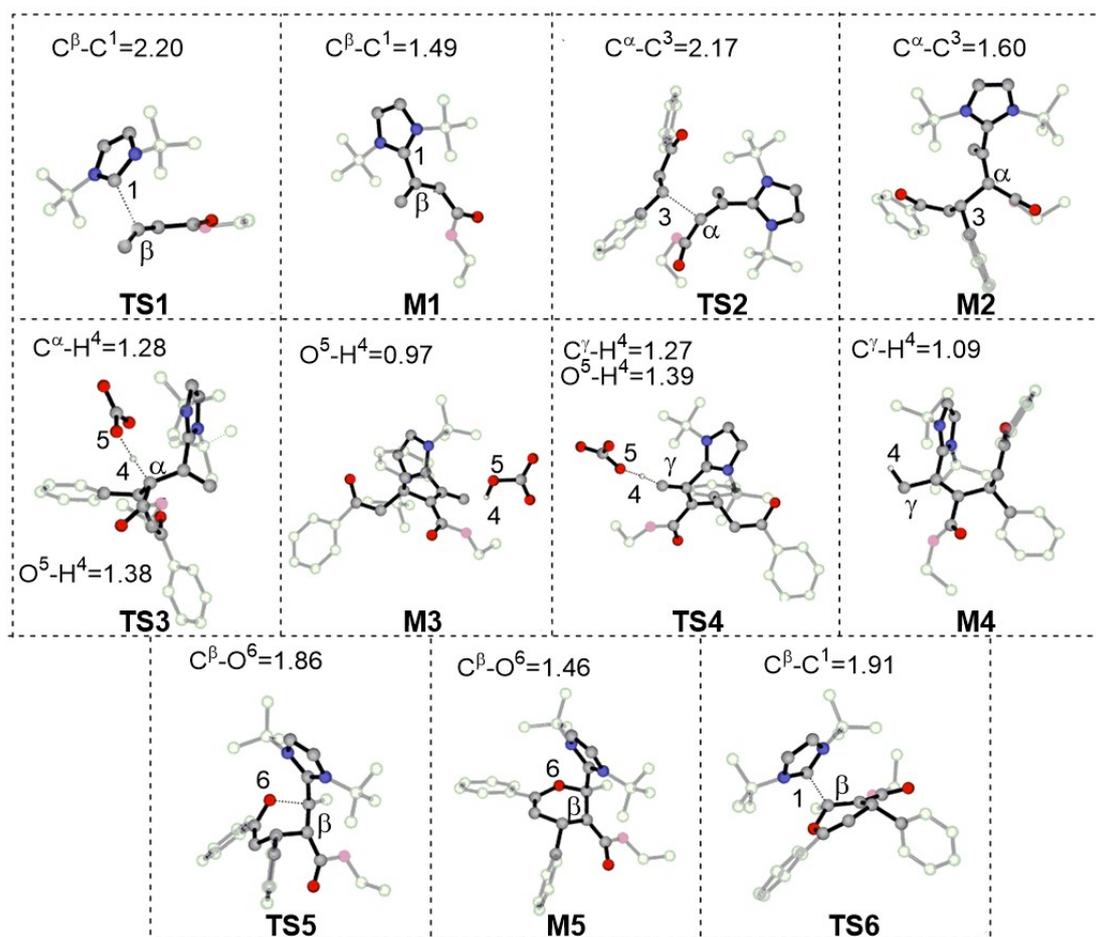

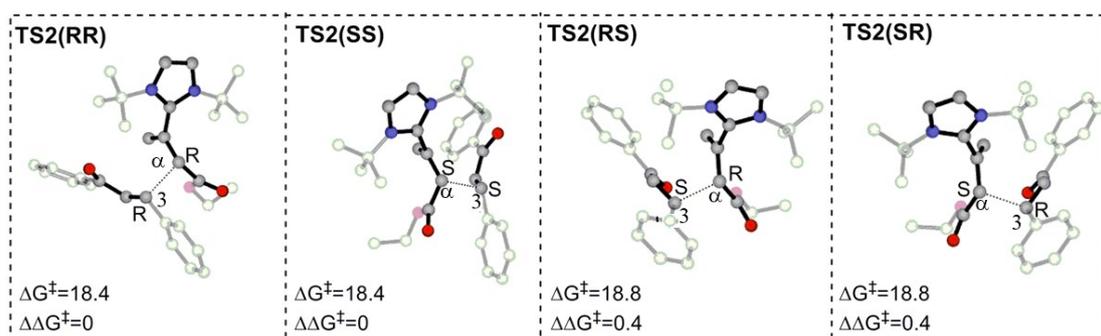

Fig. S1 Optimized structures and geometrical parameters of the stationary points (distance in Å)

### 3. The discussion for the chirality of $\alpha$ -C and C3 atoms and the choice of TS2

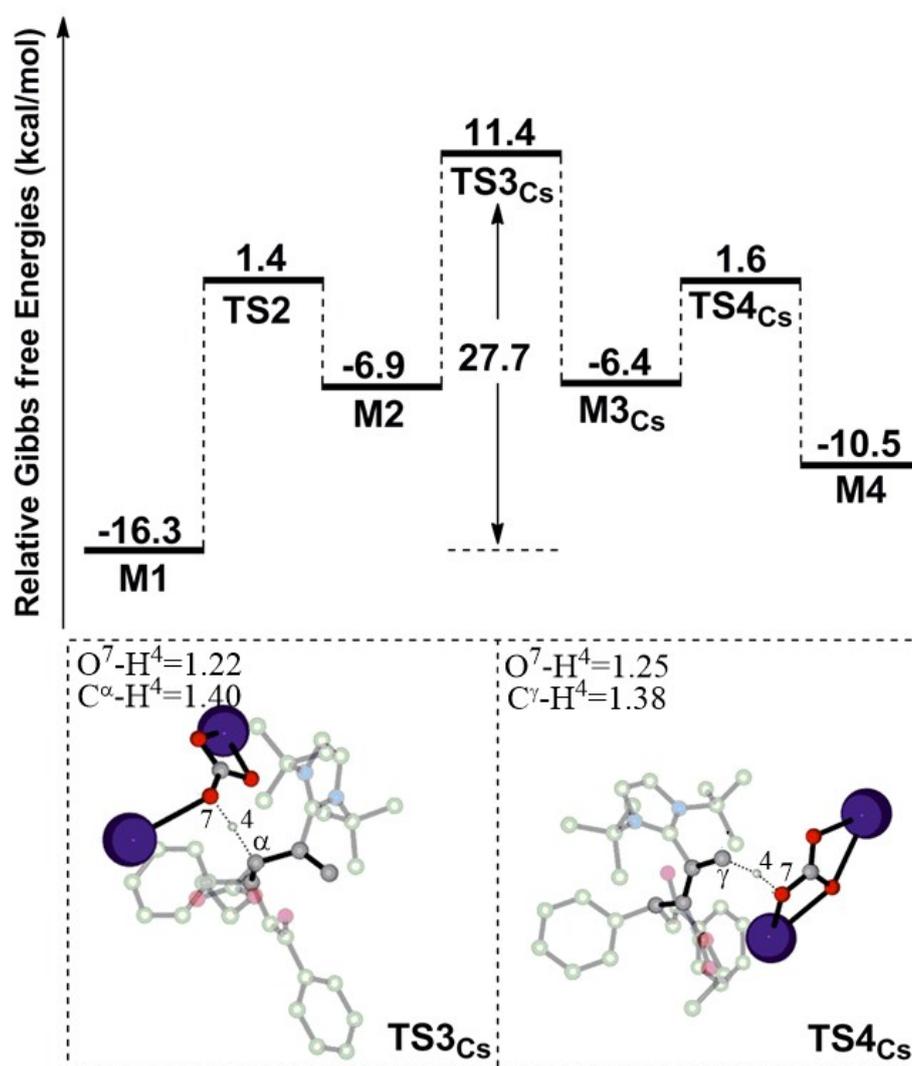

As presented in **Fig. S2**, the chiral centers ( $\alpha$ -C and C3 atoms) are formed in this step, we have also considered the chirality of  $\alpha$ -C atom, which has had not exist after the next step. Considering with the different isomers associated with the two chiral centers, we must point out that we have actually studied four possible reaction pathways, and the transition states **TS2(RR)** and **TS2(SS)** are with the lower energy barriers. Because the catalyst NHC has no chiral center, thus **TS2(RR)** and **TS2(SS)** are the image of each other (It is the same situation for **TS2(SR)** and **TS2(RS)**), which means they have the same energy in the following steps. **TS2(RR)** leads to the formation of product with *R*-configuration, and **TS2(SS)** leads to the formation of product with *S*-configuration. Therefore, we chose **TS2(RR)** as transition state **TS2** in the main text to discuss.

**Fig. S2** Possible reaction patterns for the  $C^\alpha$ -C3 bond formation step and energy barriers (unit: kcal/mol)

#### 4. The discussion of $\text{Cs}_2\text{CO}_3$ -assisted [1, 3]-proton transfer from $\alpha$ -C to $\gamma$ -C atom

We have also studied the possibility of  $\text{Cs}_2\text{CO}_3$ -assisted [1, 3]-proton transfer. As shown in **Fig. S3**, the energy barrier is 27.7 kcal/mol and is higher than the energy barrier of  $\text{CO}_3^{2-}$ -assisted [1, 3]-proton transfer. Therefore, the [1, 3]-proton transfer from  $\alpha$ -C to  $\gamma$ -C atom in the most favorable  $[\alpha, \beta]$ -[4 + 2] annulation pathway is mainly assisted by  $\text{HCO}_3^-$  anion.

**Fig. S3** The relative Gibbs free energy profiles of  $\text{Cs}_2\text{CO}_3$ -assisted [1, 3]-proton transfer from  $\alpha$ -C to  $\gamma$ -C atom and the optimized structures of transition states (distance in Å)

---

## 5. Tests of the different computational methods

We have employed at the B3LYP-D3/6-311++G(2d, 2p)//IEF-PCM<sub>acetonitrile</sub> & B3LYP-D3/6-31G(d, p)//IEF-PCM<sub>acetonitrile</sub>, B3PW91-D3/6-311++G(2d, 2p)//IEF-PCM<sub>acetonitrile</sub> & B3PW91-D3/6-31G(d, p)//IEF-PCM<sub>acetonitrile</sub>, and  $\omega$ B97X-D/6-311++G(2d, 2p)//IEF-PCM<sub>acetonitrile</sub> &  $\omega$ B97X-D/6-31G(d, p)//IEF-PCM<sub>acetonitrile</sub> methods to re-calculate the first and second steps of the most favorable  $[\alpha, \beta]$ -[4 + 2] annulation pathway and the correction of single-point energies of the optimized structures with high basis set. As summarized in **Table S1**, the computed results by using different methods including M06-2X, B3PW91-D3, B3LYP-D3, and  $\omega$ B97X-D have the same trend and small differences with those discussed above, indicating that the selected method M06-2X functional and basis sets should be suitable and reliable for studying the NHC catalyzed  $[\alpha, \beta]$ -[4 + 2] annulation reaction.

**Table S1** The energy barriers associated with stereoselectivity-determining step by using different methods (unit: kcal/mol)

	<b>M06-2X</b>	<b>B3LYP-D3</b>	<b>B3PW91-D3</b>	<b><math>\omega</math>B97X-D</b>
$\Delta G^\ddagger_{\text{step 1}}$	16.2	15.4	15.2	17.2
$\Delta G^\ddagger_{\text{step 2}}$	17.7	17.1	17.0	18.9
