I. General information

Unless otherwise noted, all commercially available compounds were used as provided without further purification. Solvents for chromatography were analytical grade and used without further purification. Anhydrous MeCN, was purchased from Sam Chemical Technology (Shanghai) Co., Ltd. Analytical thin-layer chromatography (TLC) was performed on silica gel, visualized by irradiation with UV light. For column chromatography, 200-300 mesh silica gel was used. $^1\text{H-NMR}$ and $^{13}\text{C-NMR}$ were recorded on a BRUKER 400 MHz spectrometer in CDCl_3 or $\text{DMSO-}d_6$. Data are reported in the following order: chemical shift (δ) in ppm; multiplicities are indicated s (singlet), bs (broad singlet), d (doublet), t (triplet), m (multiplet); coupling constants (J) are in Hertz (Hz). IR spectra were recorded on a BRUKER VERTEX 70 spectrophotometer and are reported in terms of frequency of absorption (cm^{-1}). HRMS spectra were obtained by using BRUKER micrOTOF-Q III instrument with ESI source.

III. General procedure and product characterization

1. General procedure for the formation of 4aaa

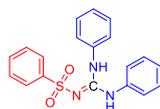

In a 25 mL oven-dried reaction tube, a mixture of TsN₃ **1a** (0.2 mmol, 1 equiv), aniline **2a** (0.44 mmol, 2.2 equiv), 1,2-dicyano-4,5-dimethylbenzene **3a** (0.4 mmol, 2 equiv), Co(acac)₂ (5 mol %), were added in 2 mL dry MeCN with 100 μL H₂O. The tube was sealed with a rubber cap and the resulting mixture was stirred at 80 $^{\circ}\text{C}$ for 6 h (checked by TLC). After 6 h, cooled to rt. The system was evaporated under the reduced pressure directly. The residue was purified by flash column chromatography with ethyl acetate and petroleum ether (EA : PE = 1 : 50~1 : 4) as eluents to afford pure product **4aaa** in 77% yield.
