General Methods and Materials

All reactions were carried out under an atmosphere of nitrogen in dry glassware, and were monitored by analytical thin-layer chromatography (TLC), which was visualized by ultraviolet light (254 nm). All solvents were obtained from commercial sources and were purified according to standard procedures. Purification of the products was accomplished by flash chromatography using silica gel (200~300 mesh). Sodium sulfinate **2** and alcohols **3** are commercially available. 2-Bromoal **1a** is commercially available and was used without further purification. Other 2-bromoaldehydes and (*E*)-**1** were prepared according to known procedures.¹ All NMR spectra were recorded on spectrometers, running at 300 MHz or 500 MHz for ¹H and 75 MHz for ¹³C respectively. Chemical shifts (δ) and coupling constants (J) are reported in ppm and Hz respectively. The solvent signals were used as references (residual CHCl₃ in CDCl₃: $\delta_H = 7.26$ ppm, $\delta_C = 77.0$ ppm; residual DMSO in DMSO-*d*₆: $\delta_H = 2.5$ ppm, $\delta_C = 39.5$ ppm). The following abbreviations are used to indicate the multiplicity in NMR spectra: s (singlet); d (doublet); t (triplet); q (quartet); m (multiplet). High resolution mass spectrometry (HRMS) was recorded on TOF perimer for ES⁺.

General experimental procedure for the synthesis of products **4**

To a 10 mL flask was charged with sodium sulfinate **2** (0.15 mmol), α -bromoal **1** (0.225 mmol), carbene precursor **Q** (5.4 mg, 0.015 mmol) and Li₂CO₃ (16.4 mg, 0.225 mmol). Then PhMe (1 mL) and alcohol **3** (0.45mmol) were added and the resulting mixture was stirred at room temperature for 48 h. After completion of the reaction as monitored by TLC, the solvent was evaporated under reduced pressure and the residue was purified by chromatography on silica gel using hexane/EtOAc (10:1) as eluent to afford the products **4**.

Procedure for the scale-up synthesis of product **4aa**

To a 50 mL two-neck bound-bottom flask was charged with sodium benzenesulfinate **2a** (328 mg, 2 mmol), α -bromocinnamaldehyde **1a** (624 mg, 3 mmol), carbene precursor **Q** (73 mg, 0.2 mmol) and Li₂CO₃ (144 mg, 2 mmol). Then PhMe (13 mL) and cyclohexanol (600 mg, 6 mmol) were added and the resulting mixture was stirred at rt for 48 h. After completion of the reaction as monitored by TLC, the solvent was evaporated under reduced pressure and the residue was purified by chromatography on silica gel using hexane/EtOAc (10:1) as eluent to afford product **4a** (565mg, 76%).
