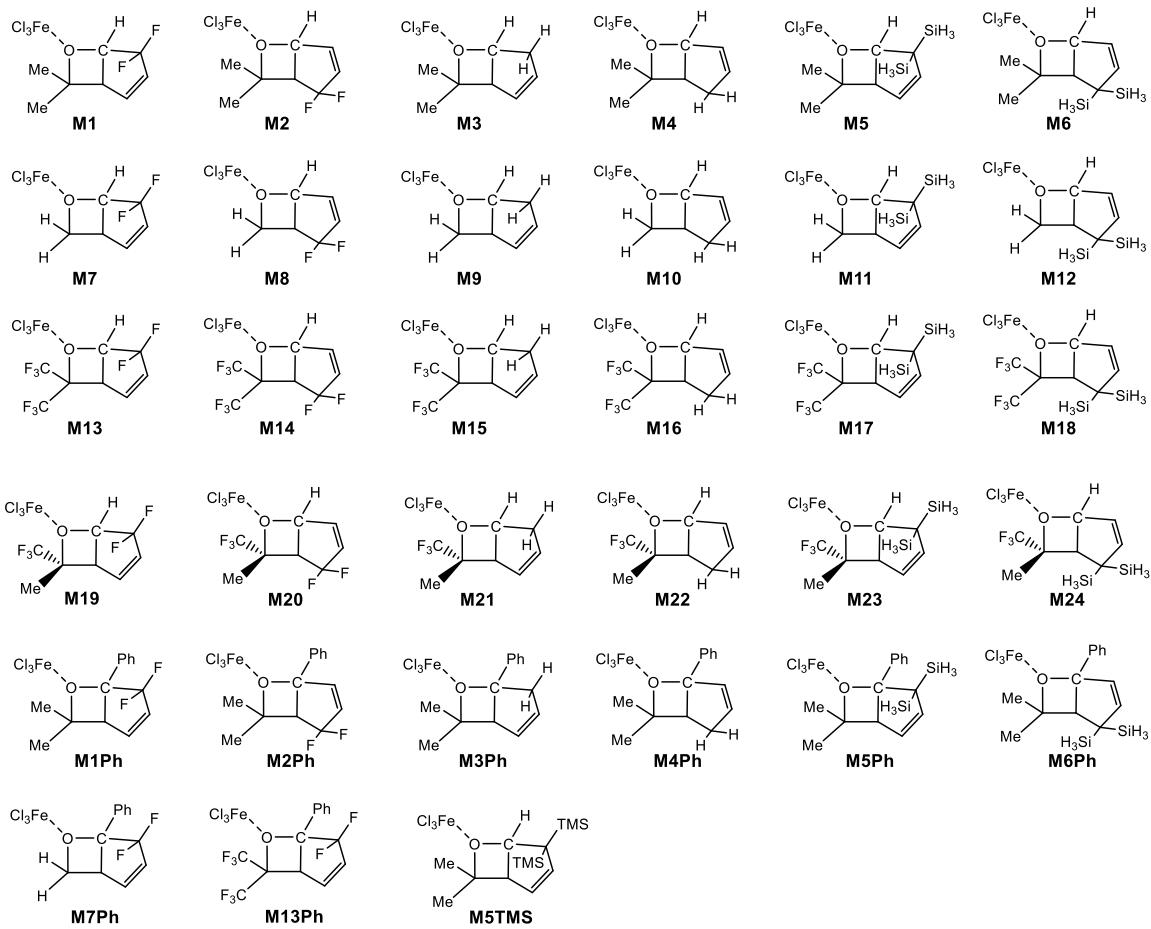

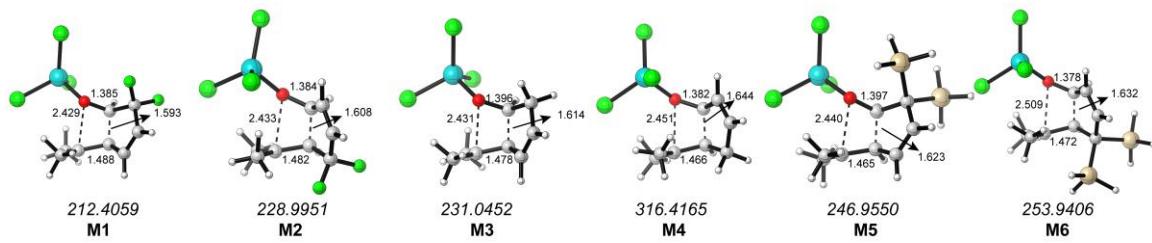

Fig. S1 Oxetane intermediates of the models investigated in this study (33 models in total)

B3LYP-D3BJ/6-31G(d)/LanL2DZ

B3LYP-D3BJ/def2-TZVP

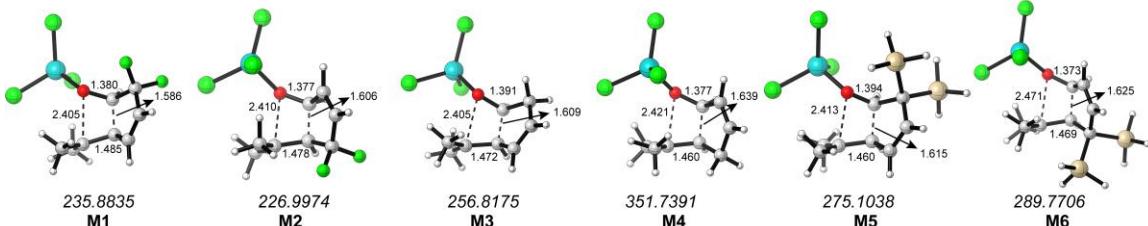

Fig. S2 Comparison between geometries optimized at the B3LYP-D3BJ/6-31G(d)/LanL2DZ and B3LYP-D3BJ/def2TZVP levels. Imaginary frequencies (in italic) are given in cm^{-1} .

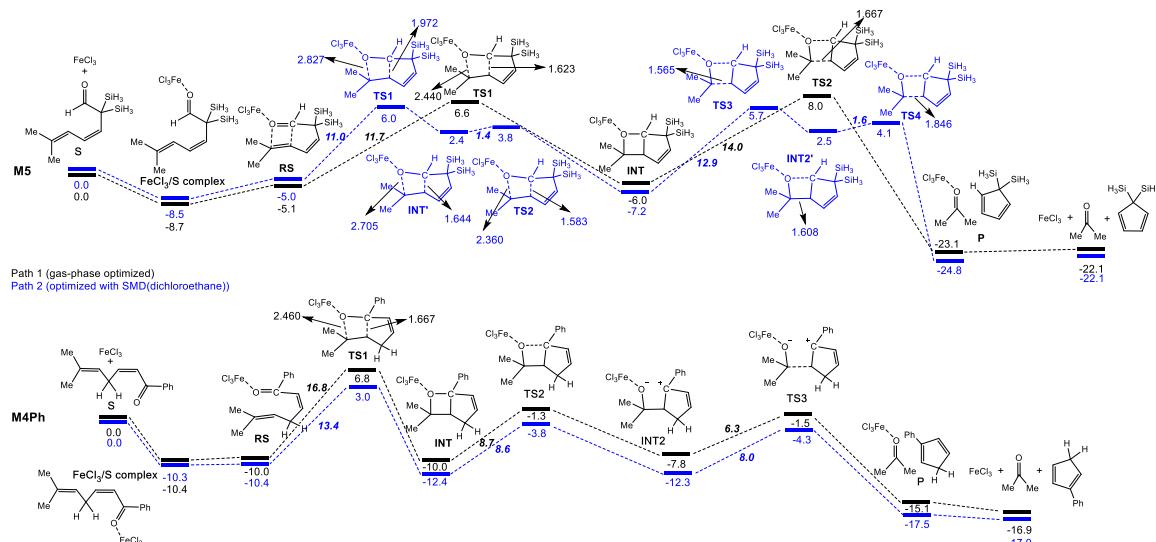

Fig. S3 Reaction profiles of **M5** and **M4Ph** with structures optimized in gas phase (Path 1) and with SMD (solvent: dichloroethane) model (Path 2). Relative Gibbs energies are calculated at 298K and given in kcal mol^{-1} . Bold, italic numbers correspond to intrinsic barriers.

For **M5**, applying the solvent model leads to additional charged-separated intermediates and more transition states in both the cycloaddition and cycloreversion. However, those intermediates (**INT'**,

INT2') of **M5** are not particularly stable, resulting in the potential energy surface (PES) rather similar to that in gas phase. In this context, the cycloaddition and cycloreversion of **M5** could still be considered concerted rather than stepwise, which was also discussed in a similar mechanistic investigation reported by Ludwig et al. (*J. Am. Chem. Soc.* **2017**, *139*, 10832-10842). Moreover, the solvent effect on the PES of **M4Ph** is also not much marked. Neglecting the addition minor barriers caused by the solvation model, the ΔG_1^\ddagger and ΔG_2^\ddagger in **M5** (Path 1/Path 2) are 15.3/14.5 and 14.0/12.9 kcal mol⁻¹ respectively while the ΔG_1^\ddagger , ΔG_2^\ddagger , and ΔG_3^\ddagger in **M4Ph** (Path 1/Path 2) are 17.2/13.4, 8.7/8.6, and 6.3/8.0 kcal mol⁻¹ respectively. Considering that the gas-phase optimization is sufficient for modelling the PES and predicting the reaction barriers and that the SMD optimization is much more costing (especially for sextet species), geometry optimizations for all models investigated in this study were performed in gas phase.

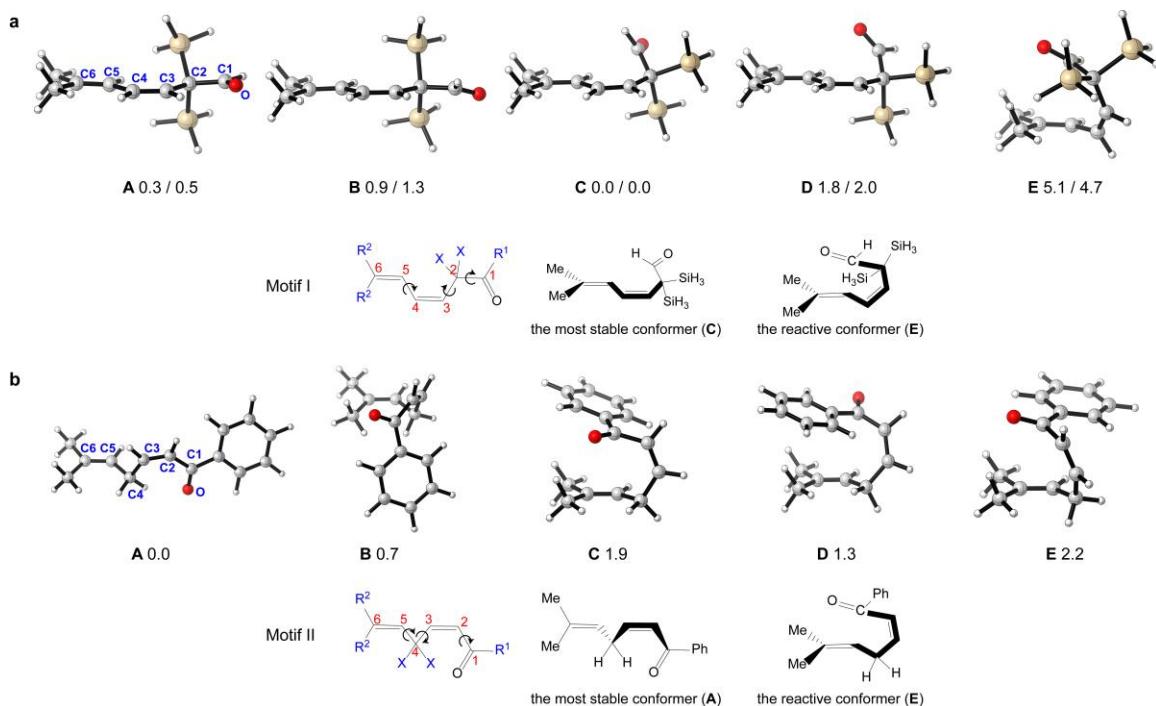

Fig. S4 Illustration of conformational sampling procedures. Motif I **(a)** and II **(b)** substrates both have three C-C single bonds that contribute to various conformations via bond rotation. Values before the “/” in **a** correspond to calculations using gas-phase optimized structures while those behind the “/” correspond to calculations using solvation model in the geometry optimizations.

In the conformational sampling, the rotation interval for each rotating bond was set to 60°, resulting in 216 initial conformer structures. Excluding those with irrational atomic distances, the rest structures were optimized using the PM7 (precise) method implemented in MOPAC2016. The

Molclus was used to submit the calculations and analyze the results, from which the conformers with lower energies were further optimized at the B3LYP-D3(BJ)/6-31G(d)/LanL2DZ level using the Gaussian 09.

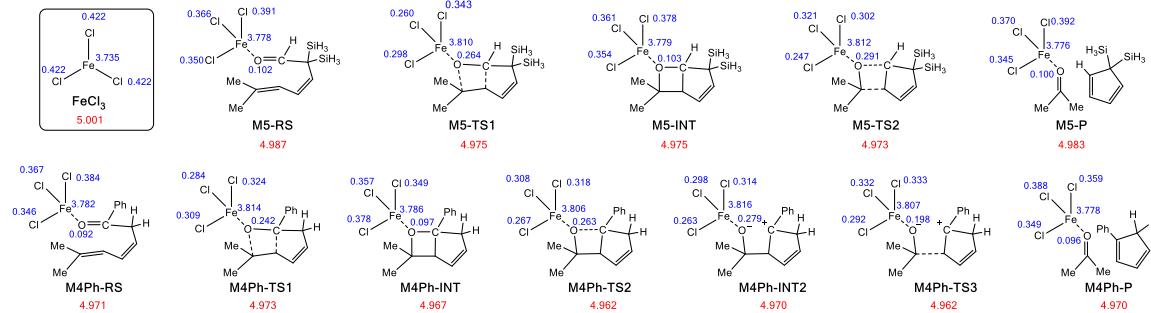

Fig. S5 Spin-density distributions (a.u.) calculated for FeCl₃ and key species of models **M5** and **M4Ph** in the sextet ground state (spin multiplicity = 6). Values in blue are spin densities of Fe, Cl, and O atoms while those in red are sums of spin densities of FeCl₃-O fragments. After FeCl₃ binds to the reactant, the spin density of the Fe(III) is partially and inevitably delocalized to the ligating atoms including three Cl and one O. Meanwhile, the rest atoms have negligible spin-density distributions along the whole reaction path. Level of theory: UB3LYP-D3(BJ)/6-31G(d)/LanL2DZ.

2Fe.M5Ph	18.4 (-2.2) (2FeCl ₃ /S → TS1)	1.3 (INT0 → TS2) ^[c]	4.6 (INT → TS3)	3.0 (INT2 → TS4)
2Fe.M6	15.6 (-3.3) (2FeCl ₃ /S → TS1)	0.7 (INT0 → TS2) ^[c]	5.9 (INT → TS3)	5.1 (INT2 → TS4)
2Fe.M6Ph	17.0 (-6.2) (2FeCl ₃ /S → TS1)	6.6 (INT → TS2)	7.7 (INT2 → TS3)	\

[a] Values in parentheses are the change of reaction barrier compared with FeCl_3 monomer models, not applicable if the mechanism is changed (e.g. from concerted to stepwise);

[b] Our calculations suggest that the $\text{2FeCl}_3/\text{S}$ complex of model **2Fe.M1** directly transforms into a more stable intermediate (**INT0**, structurally similar to **TS1** and 1.1 kcal mol⁻¹ lower in energy compared with the $\text{2FeCl}_3/\text{S}$) via no transition state, followed by the oxetane (**INT**) formation via the **TS1** with a small barrier (3.3 kcal mol⁻¹);

[c] Similar to the **M5** computed in solvation model, the cycloadditions in **2Fe.M2**, **2Fe.M4**, **2Fe.M5Ph** and **2Fe.M6** should be considered as concerted instead of stepwise due to the **INT0** being considerably unstable (energetically close to the next transition state);

[d] The **TS4** of **M2** leads to the undesired product due to chloride migration, similar to the **P'** in the FeCl_3 monomer model (Fig. 7).

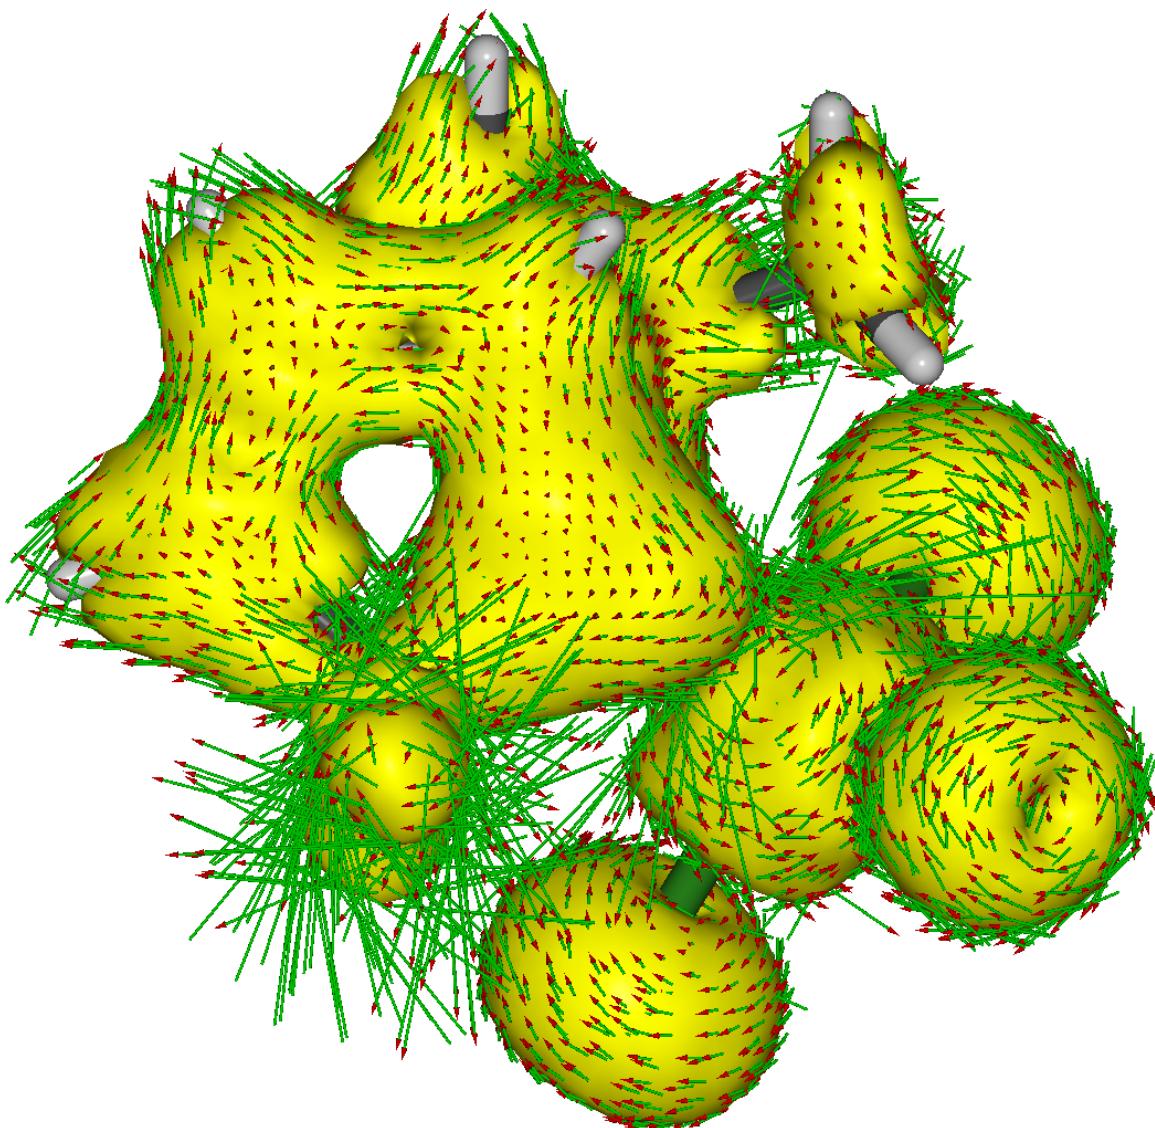

Fig. S8 ACID plot of **M1-TS2**. Isovalue: 0.035 a.u. The external magnetic field is perpendicular to the ring-plane and points out of the paper.

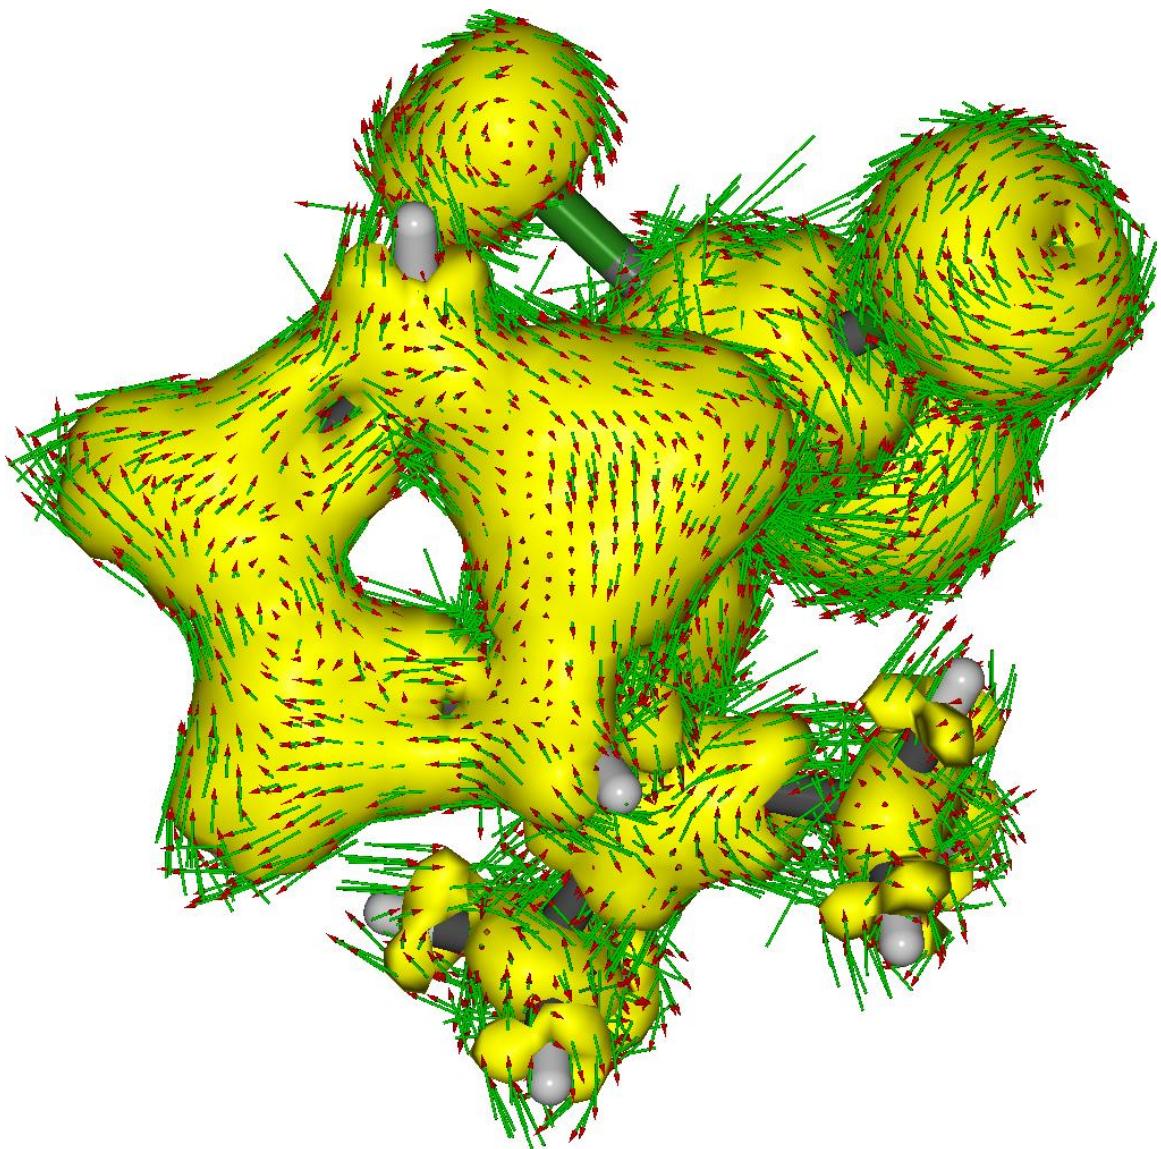

Fig. S9 ACID plot of **M3-TS2**. Isovalue: 0.035 a.u. The external magnetic field is perpendicular to the ring-plane and points out of the paper.

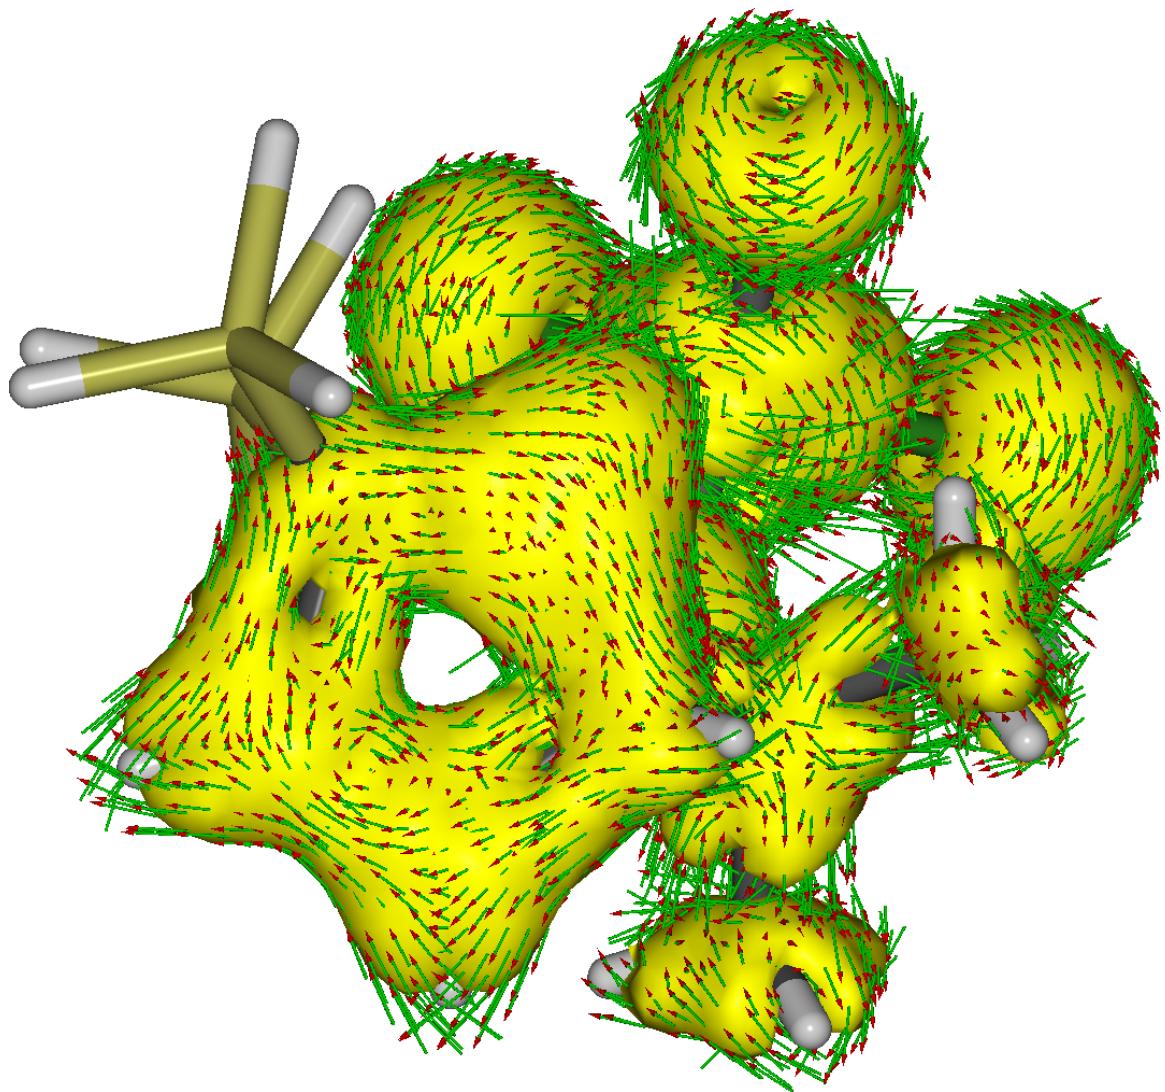

Fig. S10 ACID plot of **M5-TS2**. Isovalue: 0.035 a.u. The external magnetic field is perpendicular to the ring-plane and points out of the paper.

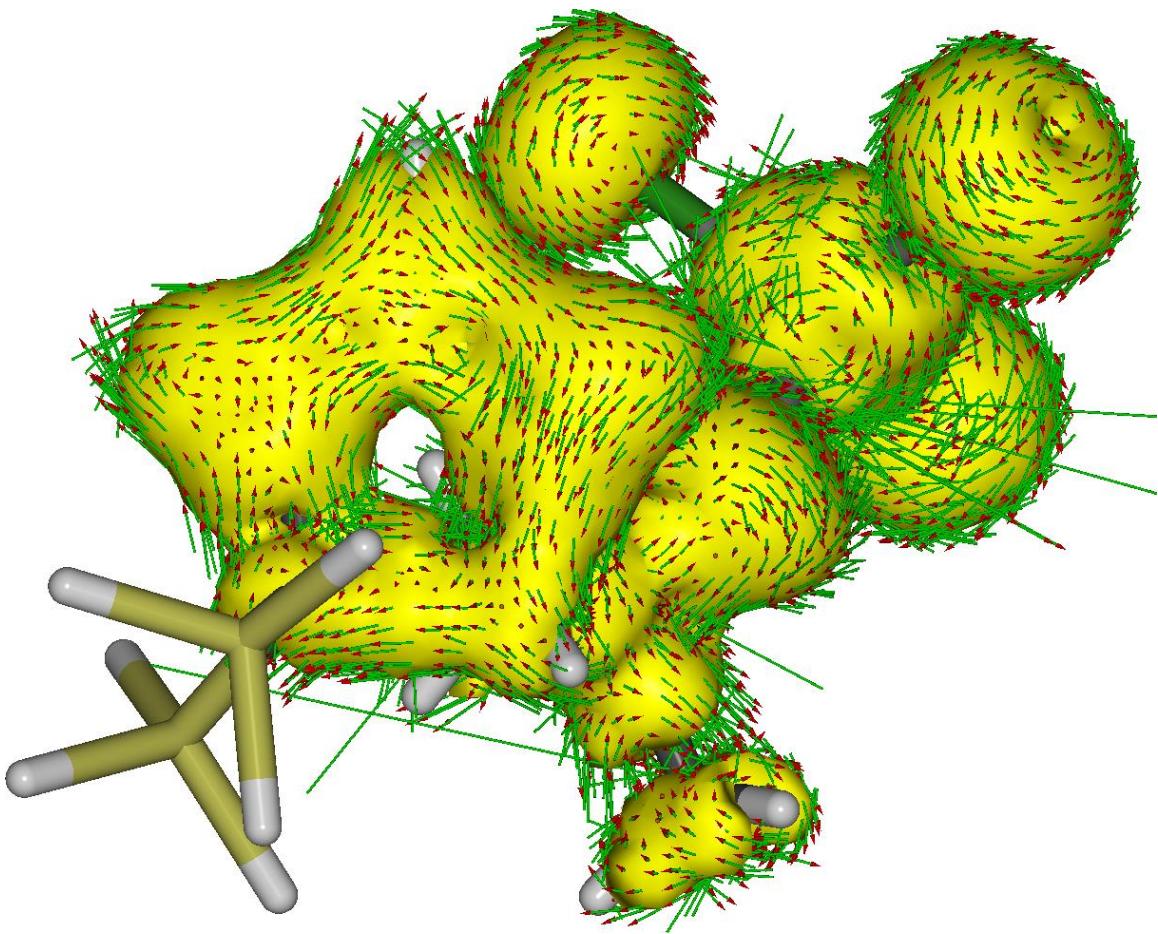

Fig. S11 ACID plot of **M6-TS2**. Isovalue: 0.035 a.u. The external magnetic field is perpendicular to the ring-plane and points out of the paper.

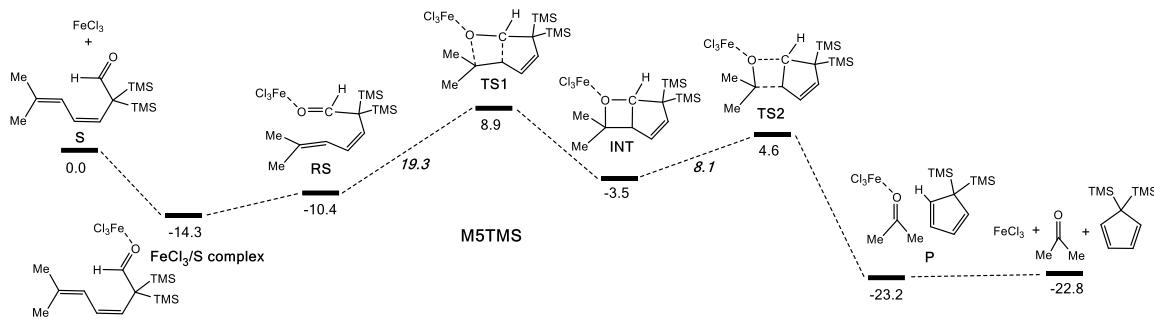

Fig. S12 Reaction profile for iron(III) catalyzed COM in **M5TMS**. Relative Gibbs energies (roman) and reaction barriers (italic) are given in kcal mol^{-1} . The trimethylsilyl (TMS) is commonly used in experiments. The cycloaddition barrier of **M5TMS** ($23.2 \text{ kcal mol}^{-1}$) is higher than that of **M5** ($15.3 \text{ kcal mol}^{-1}$). As for the cycloreversion, the activation barrier of **M5TMS** ($8.1 \text{ kcal mol}^{-1}$) is smaller than that of **M5** ($14.0 \text{ kcal mol}^{-1}$), indicating that the steric repulsion introduced by TMS groups might increase the cycloaddition barrier but decrease the cycloreversion barrier.

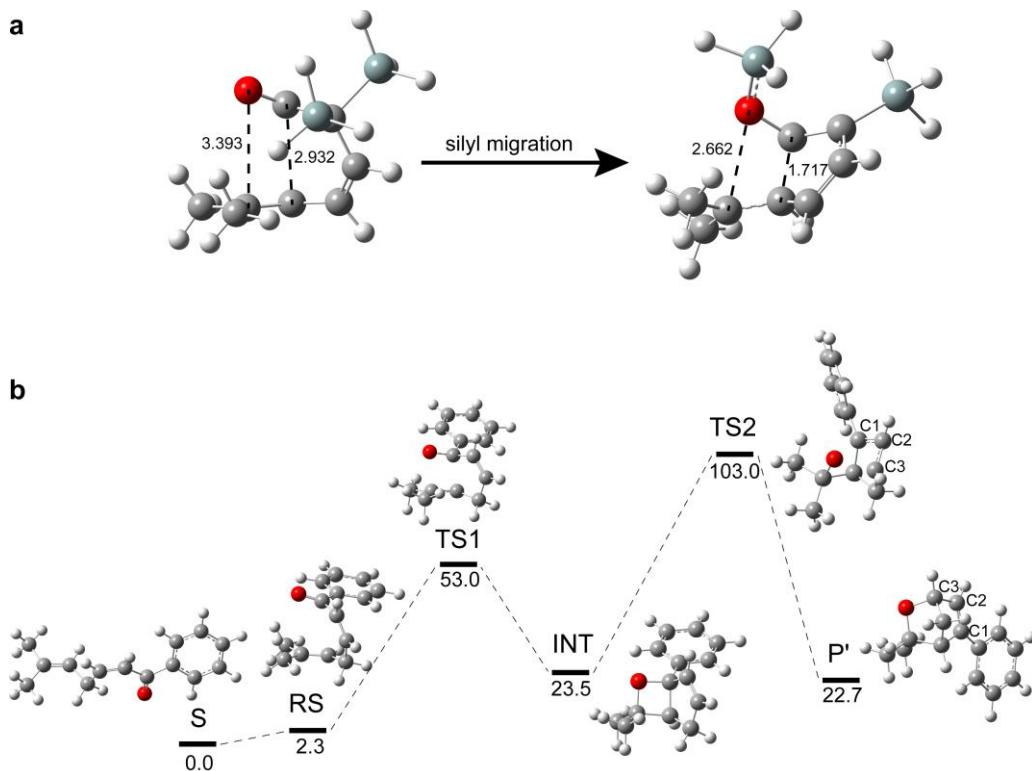

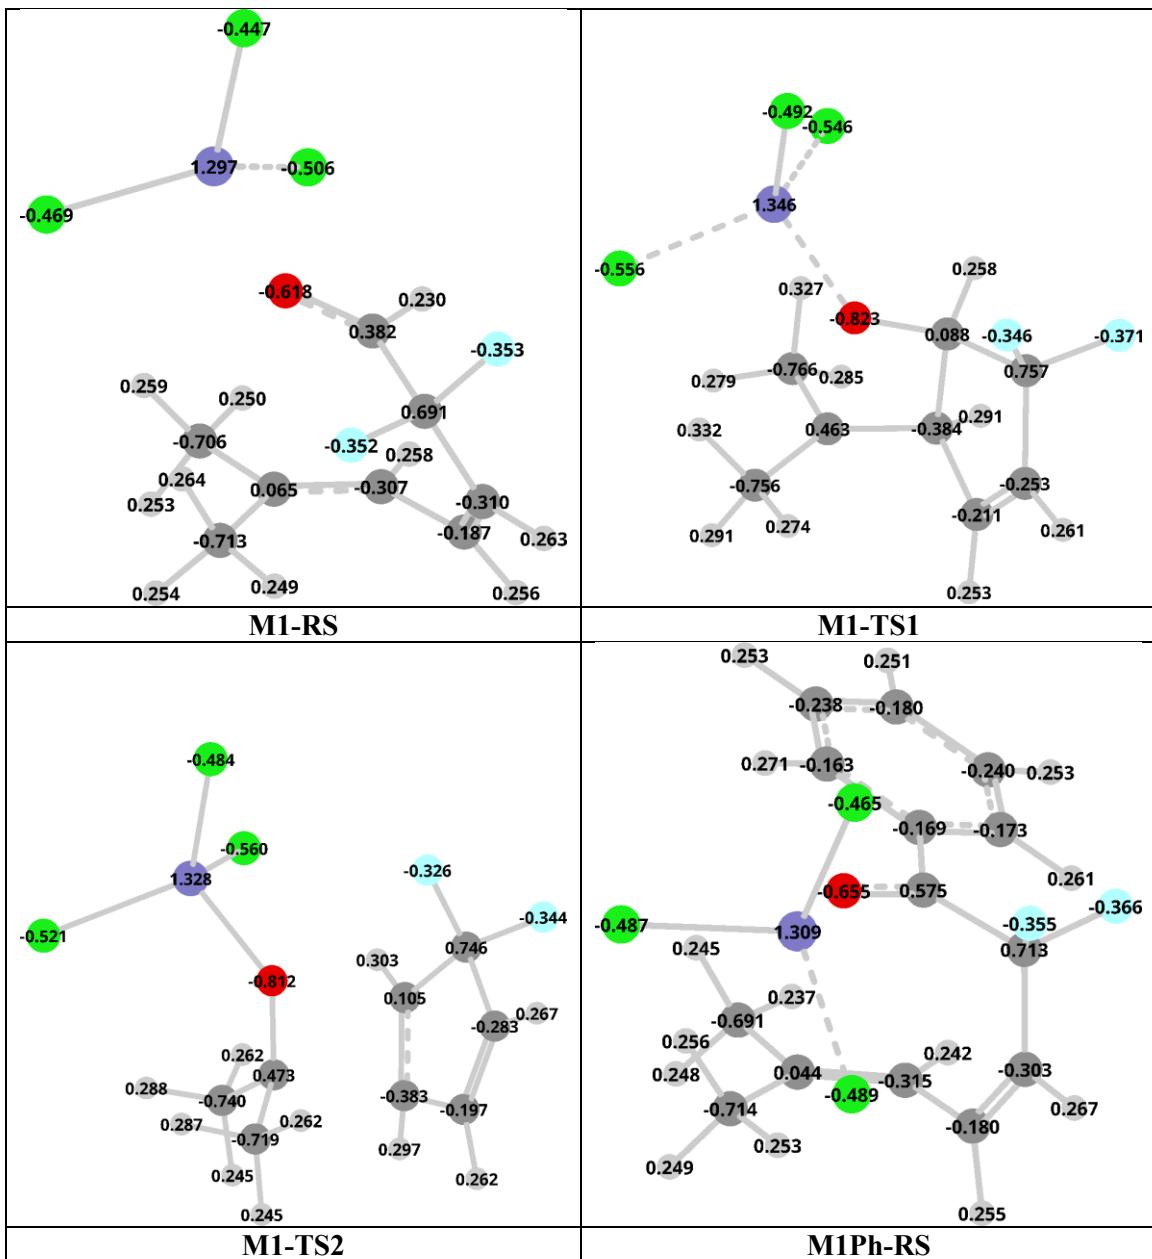

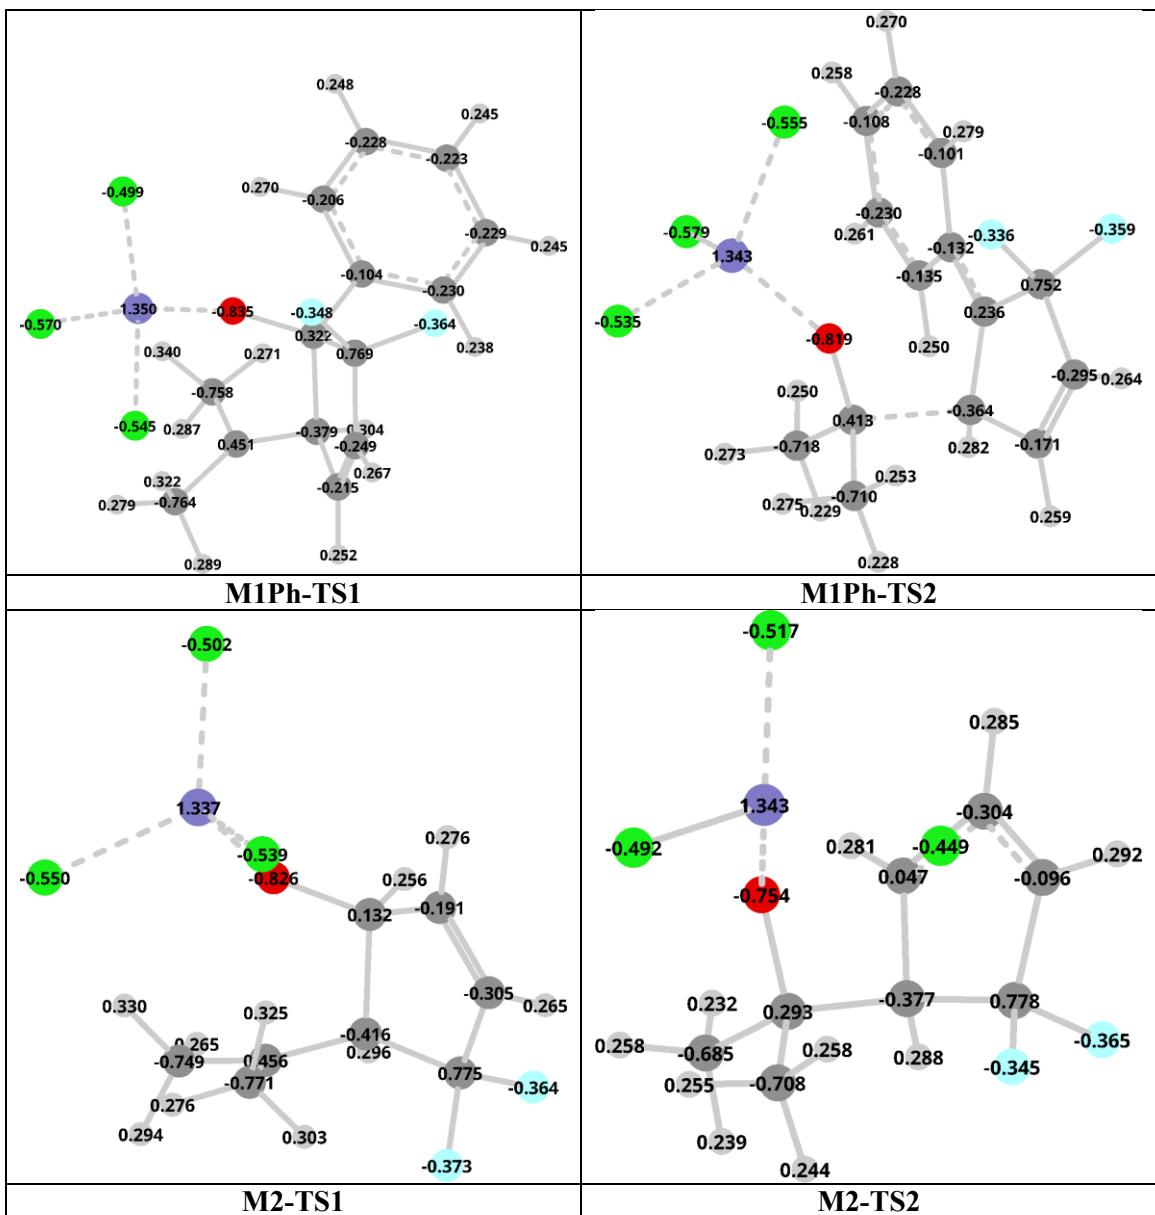

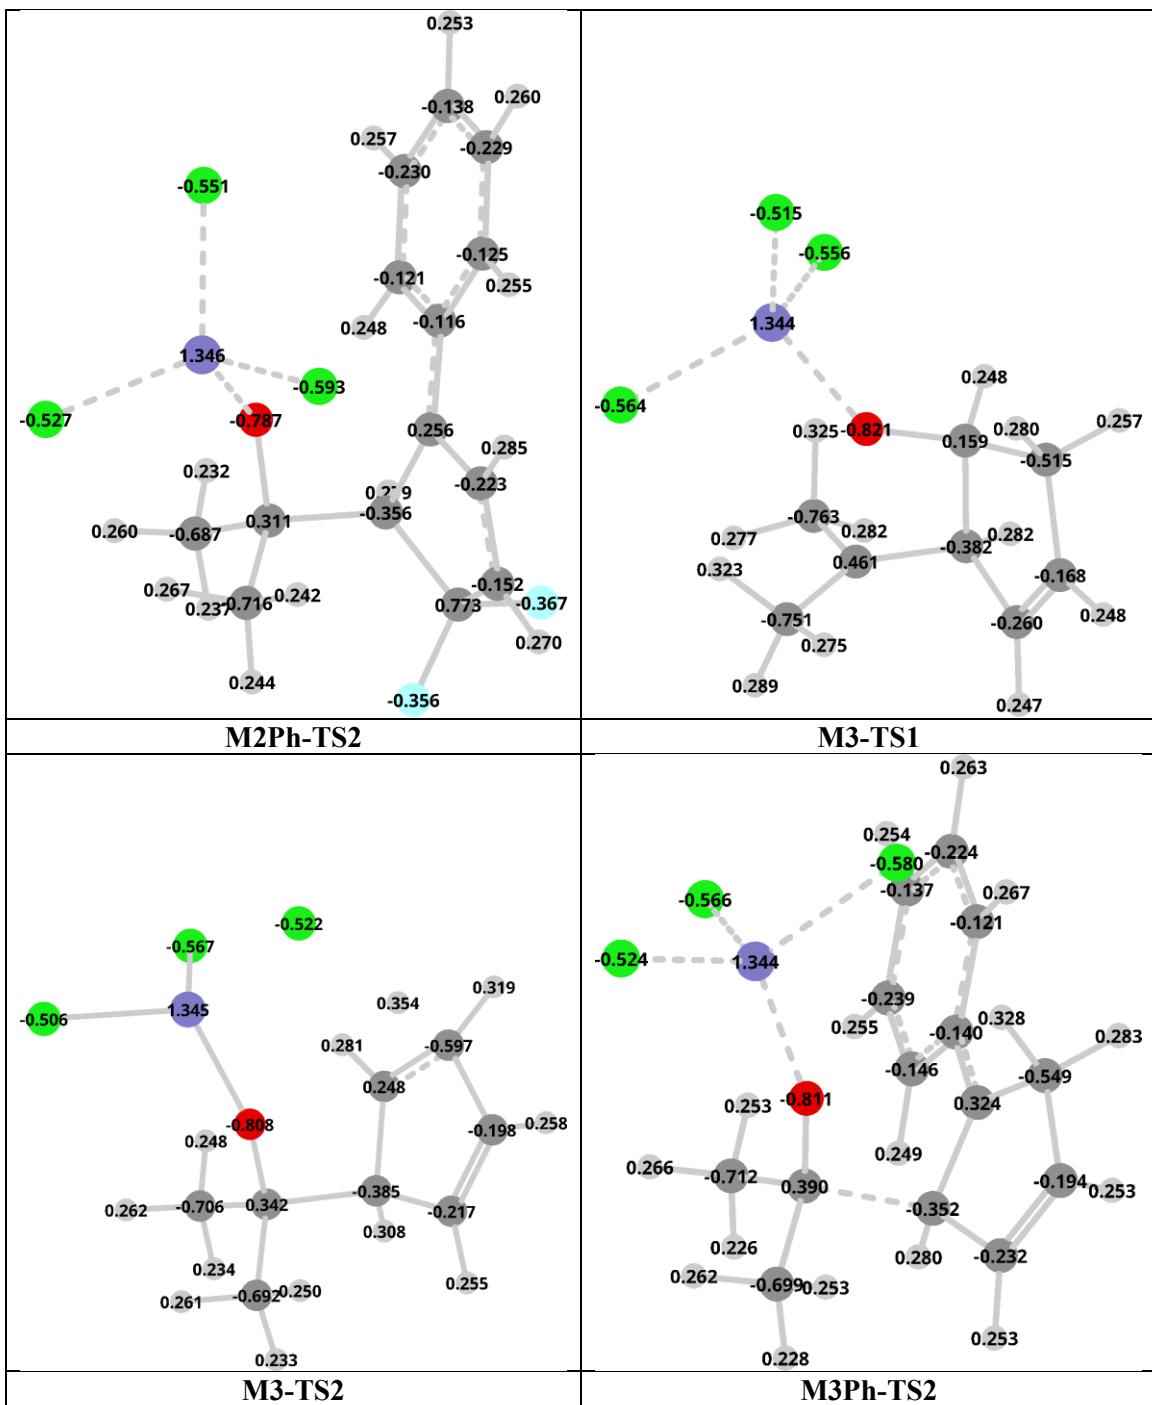

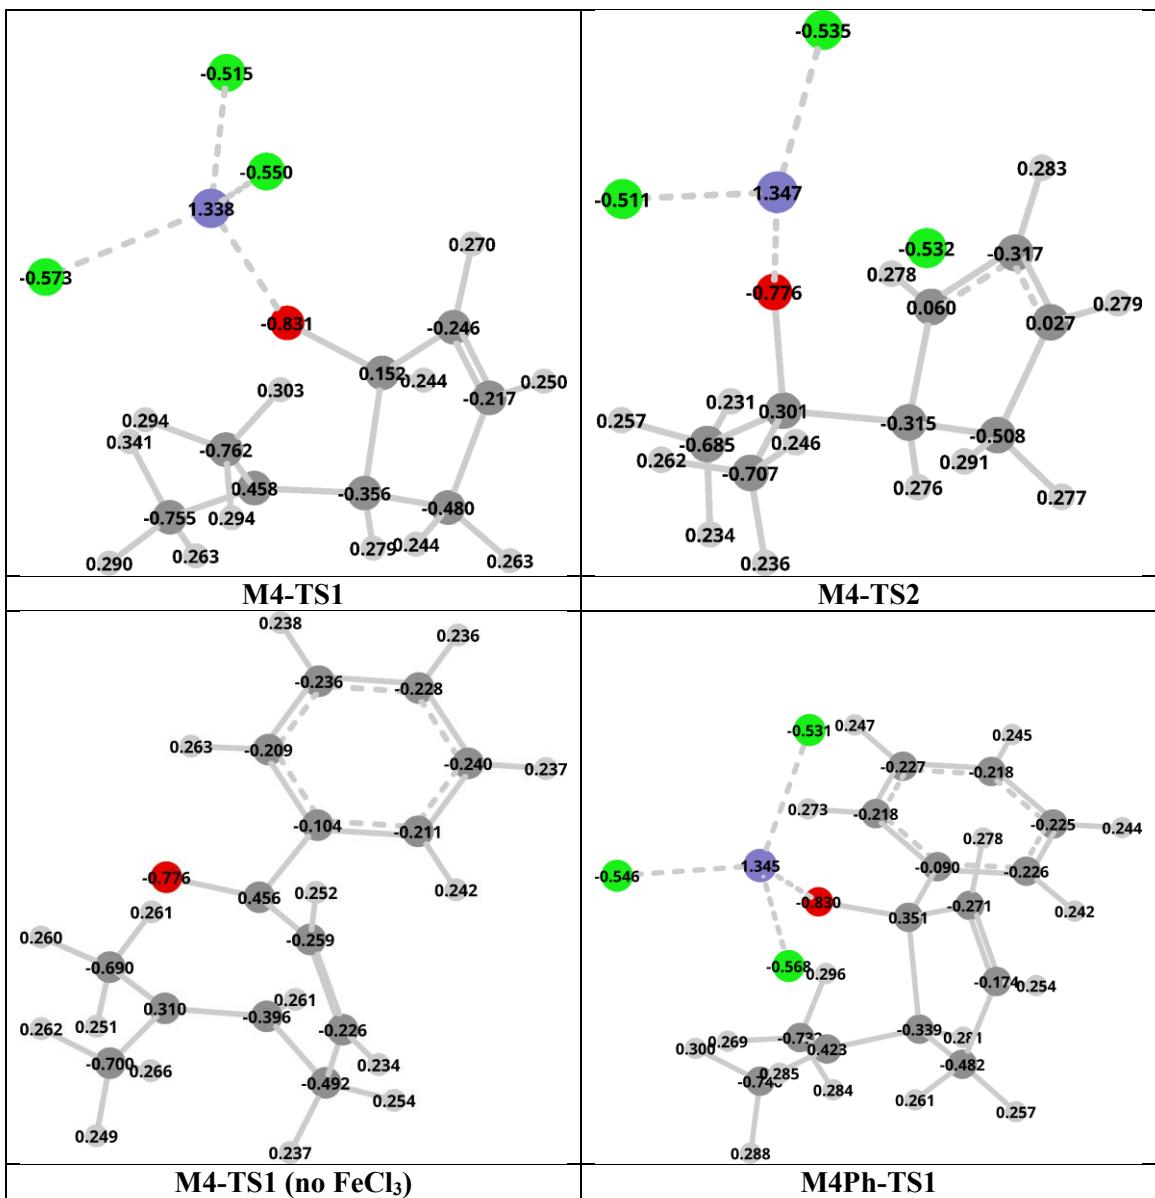

Fig. S13 Silyl migration in **M5** (a) and cycloaddition in **M4Ph** (b) without the presence of FeCl_3 . Normal cycloreversion cannot be completed in **M4Ph** without FeCl_3 because it prefers the bonding of O-C3 rather than oxetane fragmentation after **TS2**. Distances of C5-C1 and O-C6 in a are given in \AA . Relative Gibbs energies in b are given in kcal mol^{-1} .

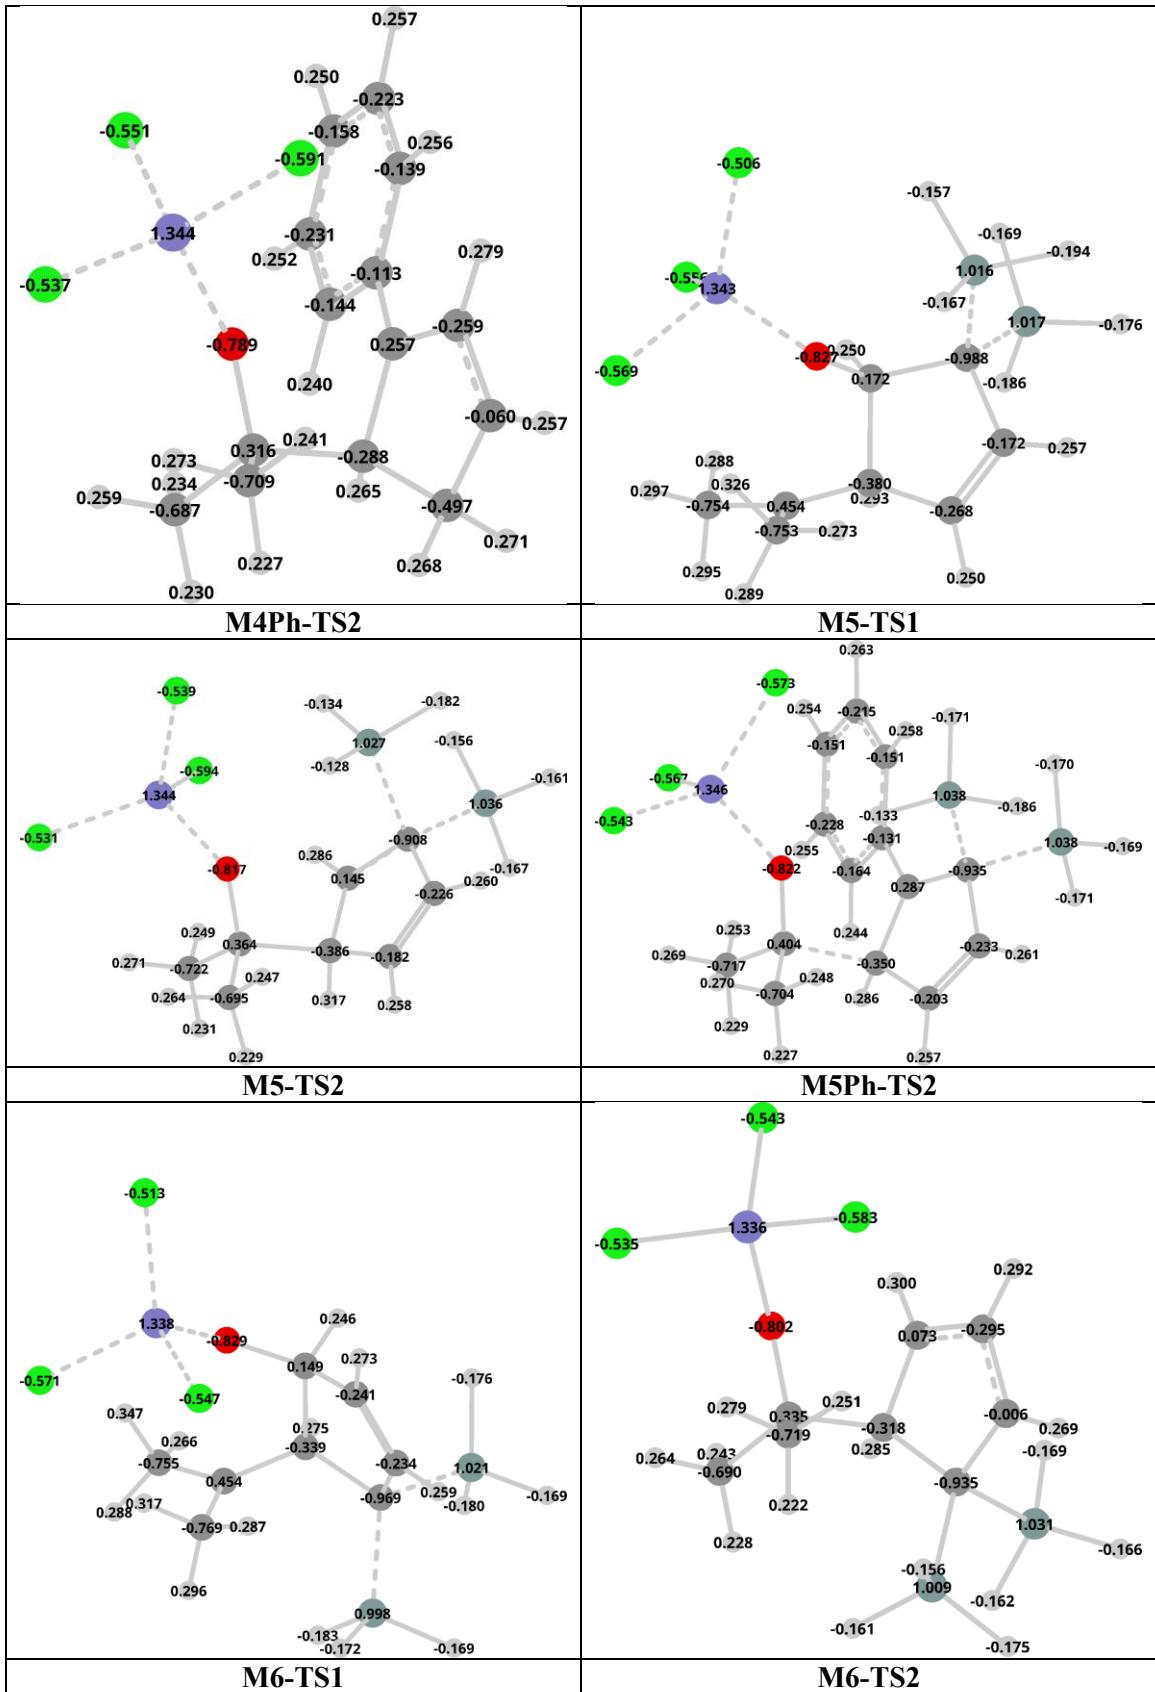

Table S6 Detailed NPA charges of atoms

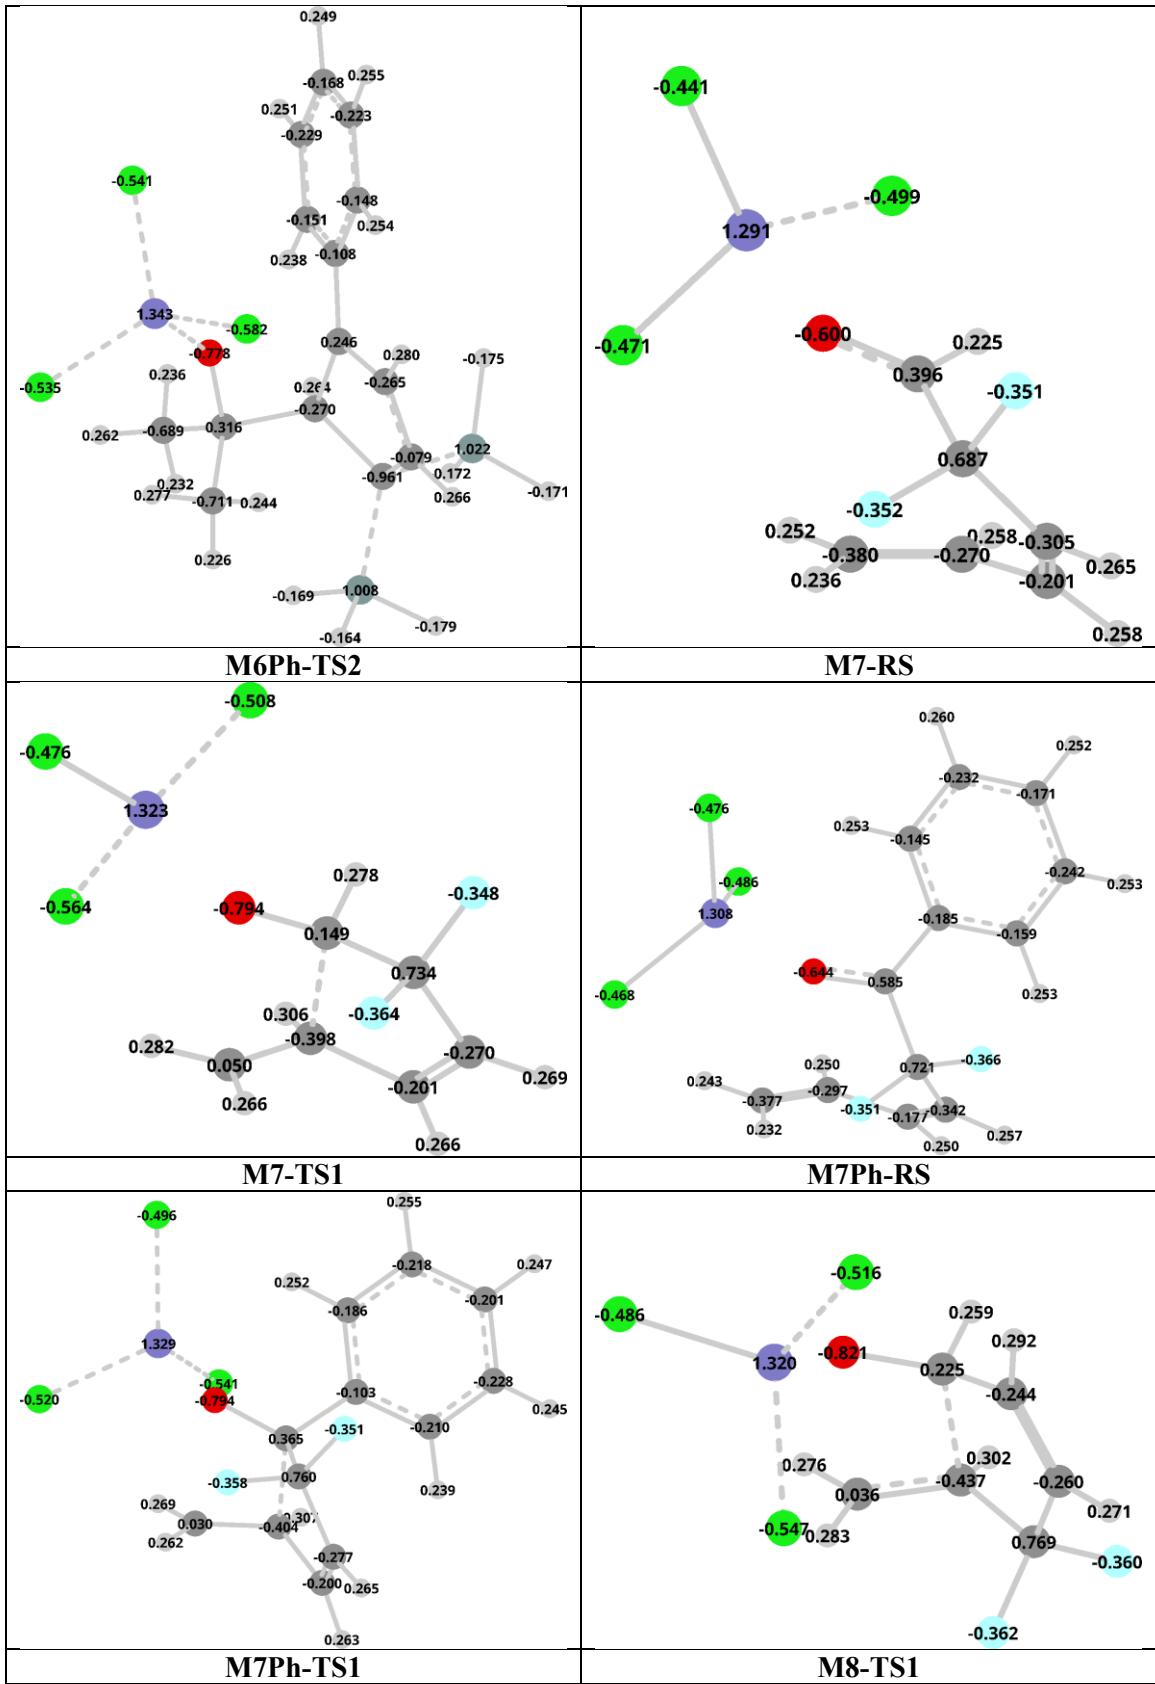

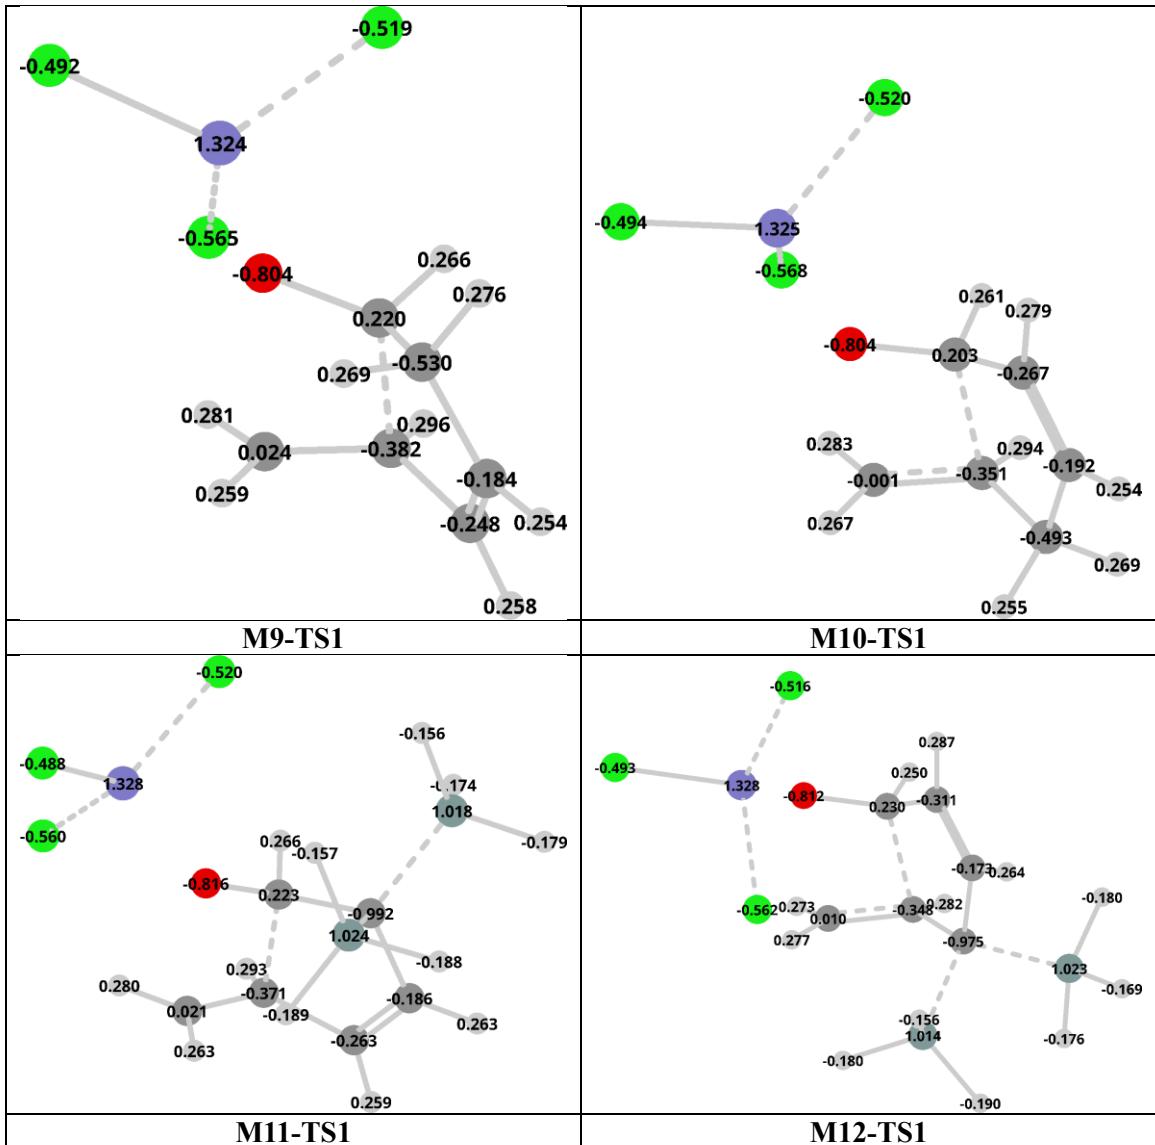

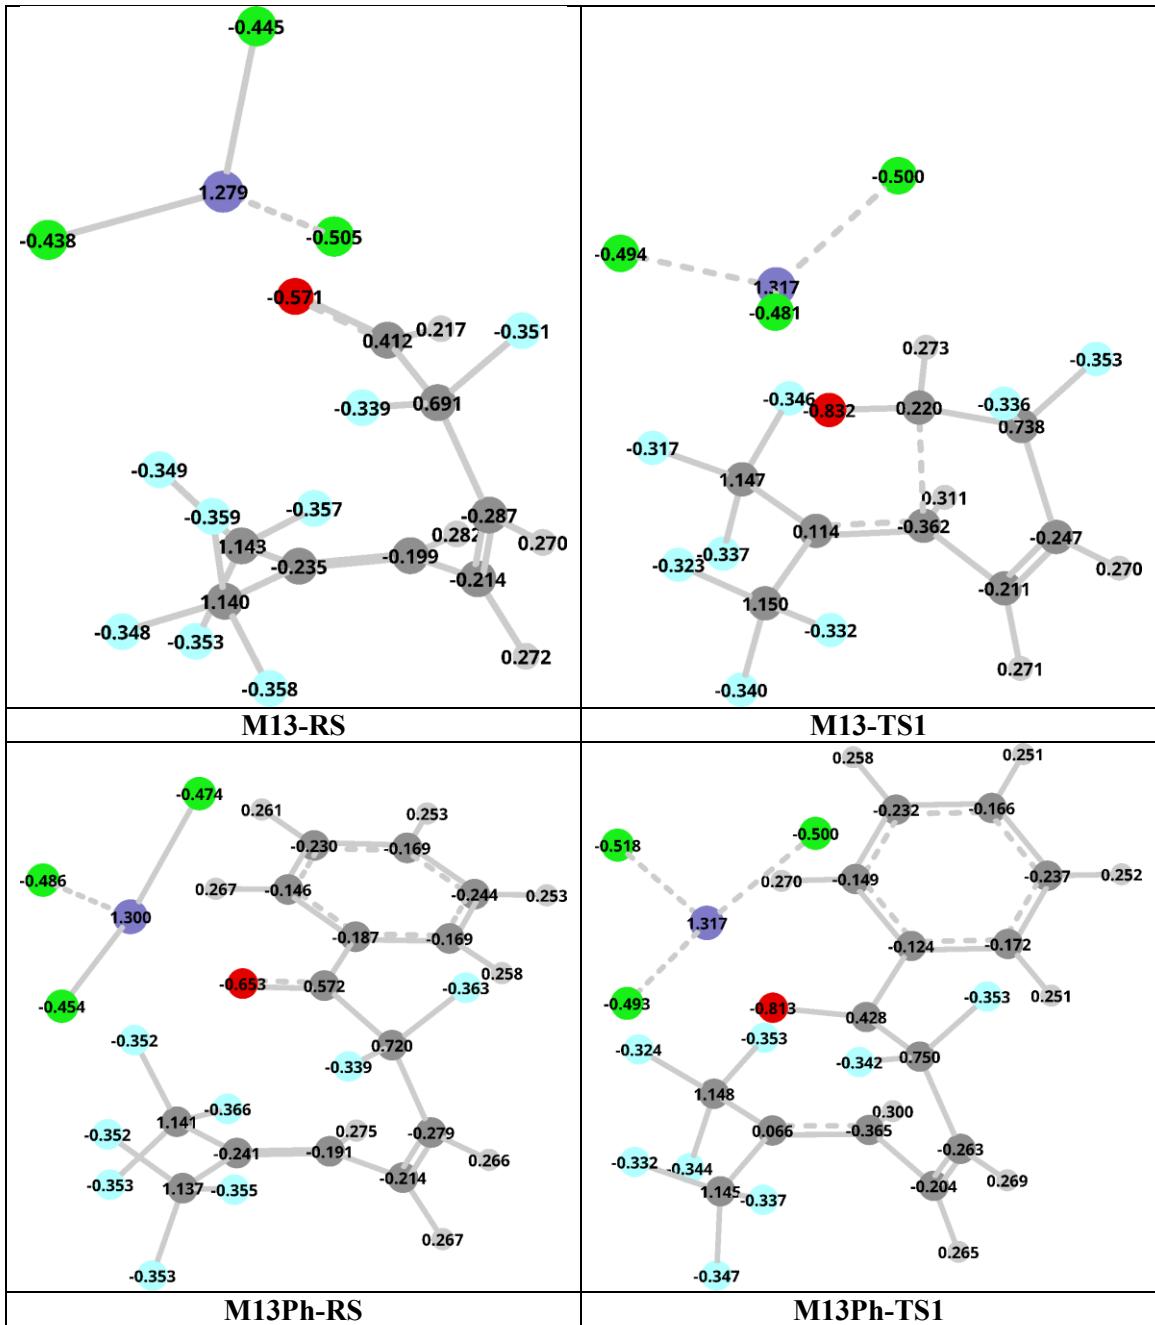

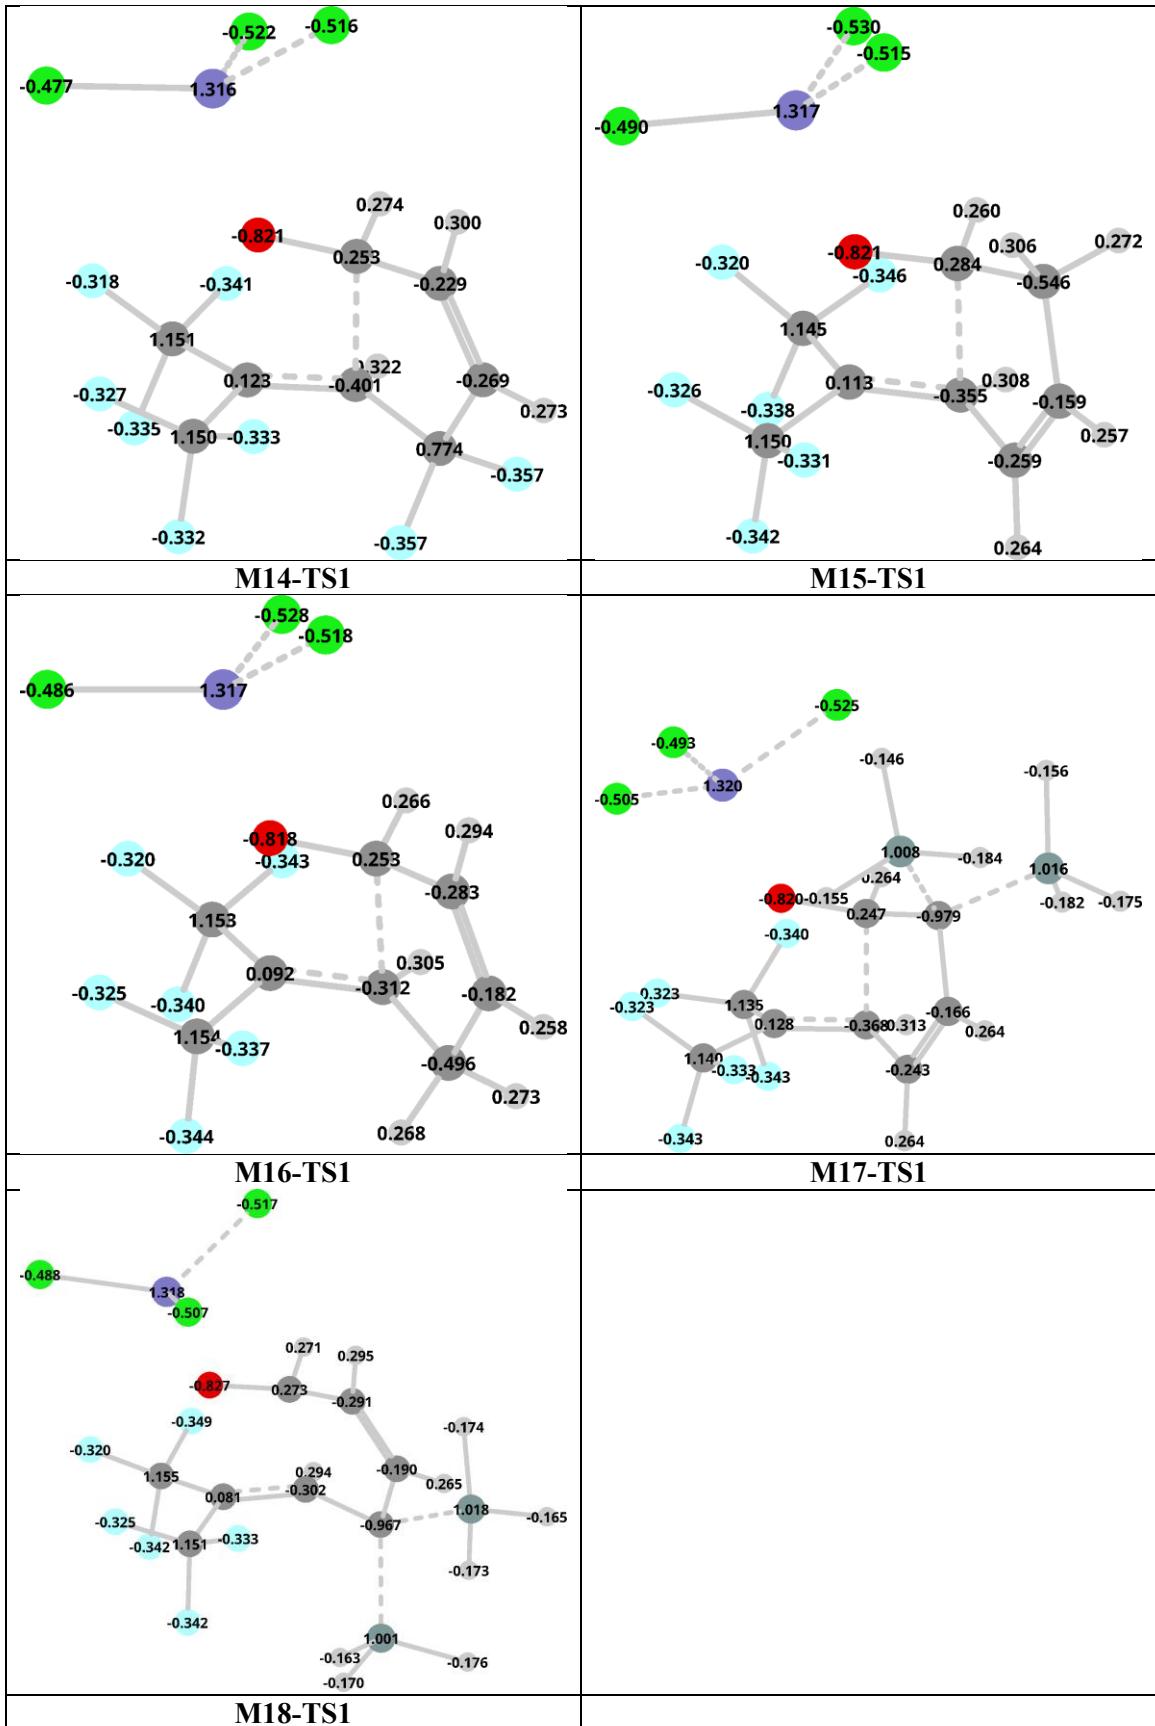

Table S7 Cartesian coordinates, thermal corrections, and electronic energies of key structures. All geometries were optimized in gas phase and in sextet state unless otherwise specified. The **FeCl₃/S** is the catalyst/substrate complex with the most stable conformation. Imaginary frequencies are given in cm⁻¹.
