1. General information:

Column chromatography silica gel (200–300 mesh) and TLC plate were purchased from Qingdao Meijin Chemical Inc(Qingdao; China); HRMS data were obtained in the ESI mode on an Agilent 6530 Q-TOF/MS system. ^1H NMR and ^{13}C NMR spectra were recorded on Bruker 400 MHz spectrometer and chemical shifts were given in δ with TMS as an internal reference.

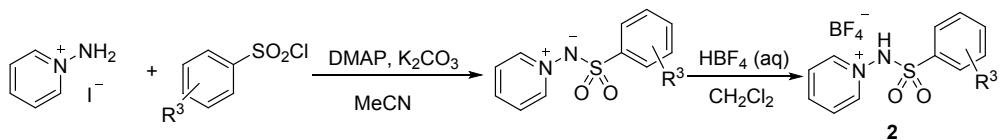

2. General procedure for synthesis of enol acetates **1** [1]:

A 100 mL flask equipped with a magnetic stir bar, a reflux condenser and a drying tube was charged with ketone (50.0 mmol, 1.00 equiv), isopropenyl acetate (250 mmol, 5.00 equiv) and *p*-TsOH·H₂O (4.00 mmol, 0.08 equiv). The reaction mixture was heated to 120°C. After 24 h the reaction mixture was allowed to cool to room temperature and the remaining isopropenyl acetate was subsequently evaporated under reduced pressure. The residue was redissolved in Et₂O (100 mL) and the resulting solution was washed with H₂O (3×50 mL) and dried over Na₂SO₄. The solvent was evaporated *in vacuo* to give a dark red oil. The pure product was obtained by distillation under reduced pressure or by purification on SiO₂ column chromatography (DCM/hexanes, 1:1). All enol acetates **1a–1s** were synthesized and purified according to the above procedure and are in agreement with literature reference.^[2–7]

3. General procedure for the synthesis of *N*-arylsulfonyl-1-aminopyridine salts

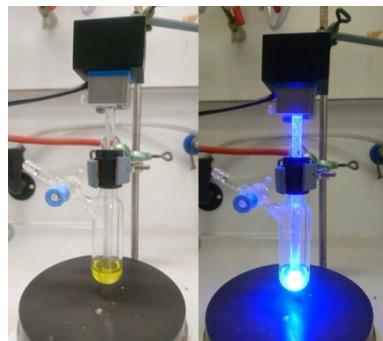

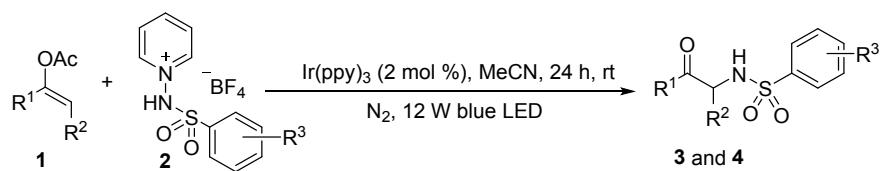

2^[8]

To a mixture of 1-aminopyridinium iodide (1 equiv) and CH₃CN (0.13 M) were added DMAP (10 mol %), K₂CO₃ (3.6 equiv) and sulfonyl chloride (1 equiv) at 0 °C

under N₂. Then, the cooling bath was removed and the reaction mixture was stirred at R.T. for 6 h. The suspension was filtered and concentrated in vacuo. The residue was suspended in CH₂Cl₂ and filtered to remove inorganic impurities. After the solvent was removed under reduced pressure, the crude product was purified by silica gel flash column chromatography (CH₂Cl₂/MeOH = 10/1) and washed with a small amount of CH₂Cl₂ to afford aminopyridinium ylide. The ylide product (1 equiv) was diluted with CH₂Cl₂ (0.3 M) and tetrafluoroboric acid solution (40 wt.% in H₂O) (1.3 equiv) was added to the solution at R.T.. The mixture was stirred for 30 min, then the product was precipitated. The mixture was filtered, washed with diethyl ether and pentane and dried in vacuo. The pure product was obtained as a white solid.

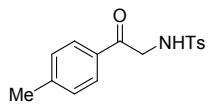

4. General procedure for the synthesis of α -sulfonylamino ketones **3** and **4**

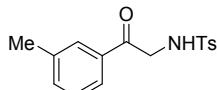

A Schlenk tube equipped with a magnetic stir bar was charged with 0.2 mmol enolacetate **1**, 2.0 equivalent of *N*-arylsulfonyl-1-aminopyridine salts **2**, 1 mol% of photocatalysis Ir(ppy)₃ and 2 mL DMSO under N₂ atmosphere. The flask was sealed by a plastic screw-cap with a Teflon sealed inlet for a glass rod. A high power LED ($\lambda = 455$ nm) was attached to the top of the glass rod, which then could act as an optical fiber. After irradiation at room temperature for 24 h, the LED was removed, the solvent was poured to 20 mL water and extracted with 20 mL EtOAc for three times. The combined organic layer was then washed with 20 mL water for three times and

evaporated giving crude product, which was purified on silica gel chromatography and eluted with PE/EtOAc to give target compounds **3** or **4**.
