**Figure S1.** <sup>1</sup>H NMR (400 MHz, CDCl<sub>3</sub>) spectrum of calix[6]arene **7**.

**Figure S2.** <sup>13</sup>C NMR (100 MHz, CDCl<sub>3</sub>) spectrum of calix[6]arene **7**.

**Figure S3.** 2D HSQC (400 MHz,  $\text{CDCl}_3$ ) spectrum of calix[6]arene **7**.

**Figure S4.** ESI-MS (+) spectrum of calix[6]arene **7**.

P[7>8]

**Figure S7.** 2D edited HSQC spectrum (400 MHz,  $\text{CDCl}_3$ ) of pseudorotaxane P[7>8] (cross-peaks correlating secondary carbons in red contours). The most representative assignments have been indicated with letters according to the above sketch.

**Figure S10.** 2D edited HSQC spectrum (400 MHz, CDCl<sub>3</sub>) of pseudorotaxane **9** (cross-peaks correlating secondary carbons in red contours). The most representative assignments have been indicated with letters according to the above sketch.

**Figure S11.** Superimposed <sup>1</sup>H-<sup>13</sup>C 2D HSQC spectra (expanded region) in CDCl<sub>3</sub> of pseudorotaxane P[7>8] (black contour lines) and of self-threaded calix[6]arene 9 (red contour lines). The linkage between the axial component and the calix[6]arene wheel was confirmed by the disappearing of the cross-peak relative to the methylester group (*o*) at (*F*<sub>2</sub>, *F*<sub>1</sub>) = 3.69, 52.0 ppm and by the downfield shift of the cross-peak relative to the methylene group (*1*) from (*F*<sub>2</sub>, *F*<sub>1</sub>) = 3.58, 62.1 ppm (black contour lines) to (*F*<sub>2</sub>, *F*<sub>1</sub>) = 4.16, 63.2 ppm (red contour lines). The *F*<sub>2</sub> projection is relative to pseudorotaxane P[7>8]. For the labels, see the scheme above the spectrum.

**Figure S12.** ESI-MS (+) spectrum of calix[6]arene **9**

**Figure S13.**  $^1\text{H}$  NMR (400 MHz,  $\text{CDCl}_3$ ) spectrum of calix[6]arene **11**.

**Figure S14.**  $^{13}\text{C}$  NMR (100 MHz,  $\text{CDCl}_3$ ) spectrum of calix[6]arene **11**.

**Figure S15.** Expanded region of the 2D TOCSY (400 MHz,  $\text{CDCl}_3$ ) spectrum of calix[6]arene **11** (mixing time = 0.08 s): the green and blue lines denote the correlations of the two alkyl chains appended to the bispyridinium core.

**Figure S16.** 2D ed.HSQC spectrum (400 MHz,  $\text{CDCl}_3$ ) of calix[6]arene **11** (secondary carbons in red).

**Figure S17.** ESI-MS (+) (Orbitrap LQ) spectrum of calix[6]arene **11**. The inset shows the real and the simulated spectra of the doubly charged species indicated by the arrow.

**Figure S18.** DOSY (400 MHz) spectra of a 7 (top) and 12 mM (down) solution in  $C_6D_6$  of calix[6]arene **9**. The measured diffusion coefficients are indicated on the spectra.

**Figure S19.** DOSY (400 MHz) spectra of a 22 mM (top) and 30 mM (down) solution in  $C_6D_6$  of calix[6]arene **9**. The measured diffusion coefficients are indicated on the spectra.

**Figure S20.** DOSY (400 MHz) spectra of a 7 mM solution in  $\text{C}_6\text{D}_6$  of pseudorotaxane  $\text{P}[1\supset 10]$ . The measured diffusion coefficients are indicated on the spectra.

**Figure S21.** DOSY (400 MHz) spectra of a 50 mM solution in  $\text{C}_6\text{D}_6$  of calix[6]arene-based [2]rotaxane **12** (top), and of calix[6]arene **9** (bottom). The measured diffusion coefficients are indicated on the spectra.

**Figure S22.** Differential pulse voltammetry of a  $1.8 \times 10^{-4}$  M solution of [1]pseudorotaxane **9** in  $\text{CH}_3\text{CN}$  in presence of 100 equivalents of  $\text{TBAPF}_6$ . The asterisk indicates the redox process of  $\text{Fc}/\text{Fc}^+$ .

**Figure S23.** Differential pulse voltammetry of a  $1.5 \times 10^{-4}$  M solution of [1]rotaxane **11** in  $\text{CH}_3\text{CN}$  in presence of 100 equivalents of  $\text{TBAPF}_6$ . The asterisk indicates the redox process of  $\text{Fc}/\text{Fc}^+$ .

**Figure S24.** Differential pulse voltammetry of a  $2.4 \times 10^{-4}$  M solution of [1]pseudorotaxane **9** in  $\text{CH}_2\text{Cl}_2$  in presence of 100 equivalents of  $\text{TBAPF}_6$ . The asterisk indicates the redox process of  $\text{Fc}/\text{Fc}^+$ .

**Figure S25.** Differential pulse voltammetry of a  $1.4 \times 10^{-4}$  M solution of [1]rotaxane **11** in  $\text{CH}_2\text{Cl}_2$  in presence of 100 equivalents of  $\text{TBAPF}_6$ . The asterisk indicates the redox process of  $\text{Fc}/\text{Fc}^+$ .

**Figure S26.** Cyclic voltammograms at different scan rates of a  $1.6 \times 10^{-4}$  M solution of [1]pseudorotaxane **9** in  $\text{CH}_3\text{CN}$  in presence of 100 equivalents of  $\text{TBAPF}_6$ . The asterisk indicates the redox wave of ferrocene used as an internal standard.

**Figure S27.** Cyclic voltammograms at different scan rates of a  $1.8 \times 10^{-4}$  M solution of [1]pseudorotaxane **9** in  $\text{CH}_2\text{Cl}_2$  in presence of 100 equivalents of  $\text{TBAPF}_6$ . The asterisk indicates the redox wave of ferrocene used as an internal standard. The weak bump on the cathodic wave at about -0.8 V is assigned to traces of oxygen.

**Figure S28.** Simulated (top) and experimental (bottom,  $1.5 \times 10^{-4}$  M, scan rate 100 mV/s) cyclic voltammograms of [1]pseudorotaxane **9** in  $\text{CH}_3\text{CN}$ . Digital simulations of the experimental CVs were obtained on the basis of the mechanism illustrated in Scheme 2 (main text) by using the software package DigiSim 3.05.<sup>[1]</sup> The voltammetric curves were simulated with the mechanism reported in Scheme 2, by fixing the values of the reduction potentials of the free ( $E_1^f$  and  $E_2^f$ ) and complexed ( $E_1^c$  and  $E_2^c$ ) species to the ones of **10** and **11**, respectively. A value of  $1 \text{ cm}^2 \text{ s}^{-1}$ , representative of a reversible process under our conditions,<sup>[2]</sup> was employed in the simulation for the free species; the value of the heterogeneous electron-transfer rate constant was estimated from the variation in the peak-to-peak separation as a function of the scan rate by using the Nicholson method<sup>[3]</sup> for the complexed species. The charge-transfer coefficients were taken as 0.5 in all cases. The quality of the simulation was judged by comparing the values of the peak potentials with the experimental data.

**Figure S29.** EPR spectrum of the radical cation **11**<sup>•+</sup> in CH<sub>2</sub>Cl<sub>2</sub>.
