## Computational Details

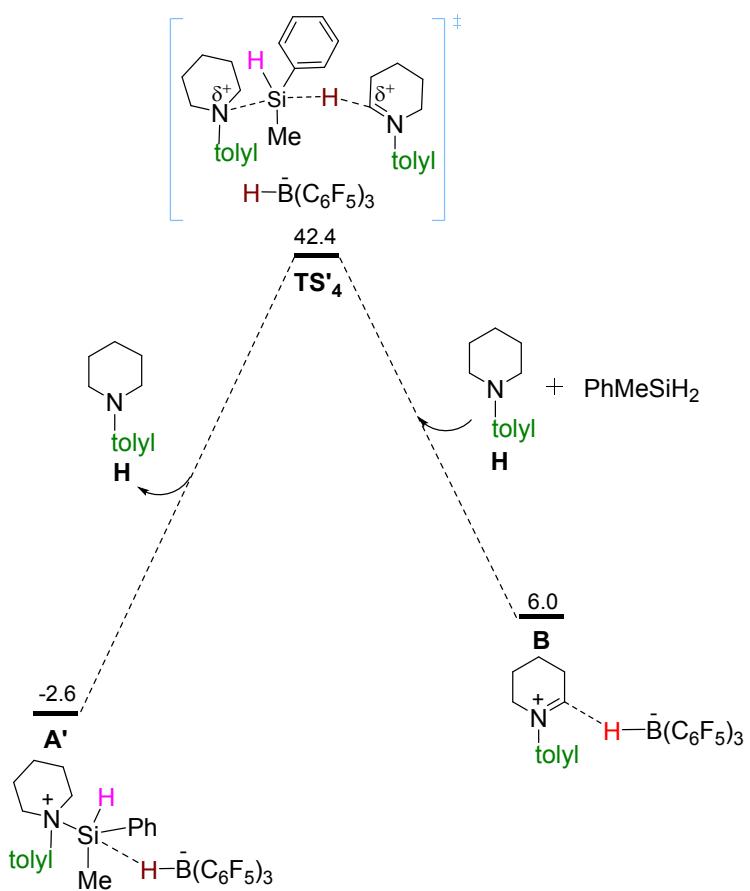

Gaussian 16<sup>1</sup> was used for all calculations in this work. Geometric structural optimization and frequency calculation were conducted by B3LYP<sup>2</sup> functional in gas phase at T = 298.15 K and 1 atm. The all-electron basis set 6-31G\*\* was used in describing the atoms (B, C, H, O, N, F).<sup>3</sup> There is no imaginary frequency for all the intermediates, while only-one imaginary frequency is in the structure of transition states. In addition, the intrinsic reaction coordinate (IRC) calculation<sup>4</sup> which correctly bridges the intermediates, further demonstrates the credibility of transition state structures. Based on the gas-phase optimized geometries, solvation effect of benzene was incorporated with the SMD<sup>5</sup> model at the level of B3LYP-D3<sup>6</sup> while 6-311++G\*\* basis set for all main group atoms.<sup>3</sup> All 3D molecular structures were generated by using the CYLview (Version) program.<sup>7</sup> Geometric structural optimization and frequency calculation in benzene as the solvent were conducted for a series of species shown in Figure 1 by using B3LYP functional and 3-21G (opt1), 6-31G (opt2) for all atoms in these calculations. The results were listed in Table S2.

**Figure S1.** Energy profile for enamine (**I**) formation by intermediate **K** as a hydrogen acceptor.

**Figure S2.** Energy profile for enamine (**I**) formation by intermediate **J** as a hydrogen acceptor.

**Figure S3.** The formation of **A'** from **B** +  $\text{PhMeSiH}_2$  + **H** via  $\text{TS}'_4$ .

**Table S1.** Calculated relative energies of **A'** and **TS<sub>4</sub>** by different DFT methods.
