1. General information

All glassware was thoroughly oven-dried. Chemicals and solvents were either purchased from commercial suppliers or purified by standard techniques. Thin-layer chromatography plates were visualized by exposure to ultraviolet light and/or staining with phosphomolybdic acid followed by heating on a hot plate. Flash chromatography was carried out using silica gel (160-200 mesh). ^1H NMR and ^{13}C NMR spectra were recorded using Bruker AV-300 / AV-400 spectrometers. Chemical shifts are given in δ relative to tetramethylsilane (TMS), Data for ^1H NMR are reported as follows: chemical shift (δ ppm), multiplicity (s = singlet, d = doublet, t = triplet, q = quartet, m = multiplet, dd = doublet), integration, coupling constant (Hz) and assignment. The spectra were recorded in CDCl_3 as the solvent at room temperature, TMS served as internal standard ($\delta = 0$ ppm) for ^1H NMR and CDCl_3 used as an internal standard ($\delta = 77.00$ ppm) for ^{13}C NMR. Optical rotations were measured on an Autopol IV (d = 589 nm, Hg lamp, 50mmcell) instrument (Rudolph, NJ, USA). High resolution mass spectra were acquired on Thermo Orbitrap Elite, instrument (Agilent, Palo Alto, CA, USA). Enantiomeric excess values were determined by HPLC with Chiralcel OD-H, IC, ID, IB columns on Agilent LC-1260 eluting with *i*-PrOH and n-hexane.

A solution of phenol **2** (0.1 mmol), MBH carbonate **3** (0.3 mmol) and catalysts **1h** (0.02 mmol) in 1, 4-dioxane (2 mL) was stirred at room temperature. The reaction was

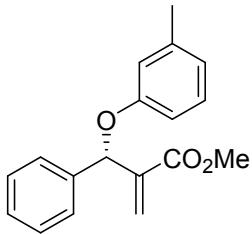

monitored by TLC spectroscopy. After the reaction time given, the reaction mixture was directly purified by flash column chromatograph (eluted with EtOAc/petroleum ether: 10:1) to afford the product **4**.
