18 Table S1 Porous structure parameters of as-prepared sample.

Samples	BET Surface	Total pore volume	Average pore width
	Area (m ² g ⁻¹)	(cm ³ g ⁻¹)	(nm)
g-C ₃ N ₄	69.6	0.15	8.54
a-Fe ₂ O ₃ /g-C ₃ N ₄ -0.25	55.0	0.13	9.57
a-Fe ₂ O ₃ /g-C ₃ N ₄ -0.5	52.2	0.14	10.55
a-Fe ₂ O ₃ /g-C ₃ N ₄ -1	45.4	0.11	9.85

19

20 Table S2 Comparison of maximum adsorption capacity of MO and MB on g-C₃N₄, a-
21 Fe₂O₃/g-C₃N₄-0.5 and other adsorbents.

Species	Materials	pH	q _{max} (mg g ⁻¹)	Ref
MO	MPC-300	5.0	25.52	¹
	De-Oiled Soya	3.0	16.66	²
	Spent tea leaves (STL) modified with PEI	3.0	62.11	³
	g-C ₃ N ₄	3.0	34.61	This work
	a-Fe ₂ O ₃ /g-C ₃ N ₄ -0.5	3.0	69.91	This work
MB	Marine seaweed	5.0	5.20	⁴
	Wheat shells	7.0	16.56	⁵
	Activated carbon	7.0	9.81	⁶
	g-C ₃ N ₄	8.0	9.66	This work
	a-Fe ₂ O ₃ /g-C ₃ N ₄ -0.5	8.0	29.46	This work

22

23 **Text S1 Isotherms model for the adsorption**24 The Langmuir isotherm was used to describe the monolayer of adsorbate on the
25 adsorbent surface and the surface homogeneity of the adsorbent. The Langmuir
26 equation could be expressed as equation (S1)⁷:

27

28
$$q_e = \frac{q_{max} C_e b}{1 + C_e b} \quad (\text{S1})$$

29 The Freundlich model indicates the multilayer adsorption and the surface
30 heterogeneity of the adsorbent. The Freundlich isotherm could be given as equation
31 (S2)⁸:

32

$$q_e = K_f C_e^{1/n} \quad (\text{S2})$$

33 where C_e (mg L⁻¹) denotes the equilibrium concentration, q_{max} (mg g⁻¹) expresses
34 the maximum theoretical saturated adsorption capacity, b (L mg⁻¹) denotes the

35 Langmuir adsorption constant, K_f ($\text{mg}^{1-n} \text{ L}^n \text{ g}^{-1}$) is the Freundlich adsorption
36 coefficient and n is the constant depicting the adsorption intensity.

37 **Text S2 Kinetics model for the adsorption**

38

39 The pseudo-first-order kinetic model is described as equation (S3) ⁷:

40

41
$$\ln (q_e - q_t) = \ln q_e - k_1 t \quad (\text{S3})$$

42

43 The pseudo-second-order kinetic model is described as equation (S4) ⁹:

44

45
$$\frac{t}{q_t} = \frac{1}{k_2 q_e^2} + \frac{t}{q_e} \quad (\text{S4})$$

46

47 where k_1 and k_2 represent the pseudo-first- and pseudo-second-order rate
48 constants, q_e and q_t (mg g^{-1}) denote the adsorption of MO/MB at equilibrium and time
49 t (min)

50

51

52

53 Table S3. Kinetic parameters for the adsorption of MO and MB on $\alpha\text{-Fe}_2\text{O}_3/\text{g-C}_3\text{N}_4$ -
54 0.5.

species	$q_{e,\text{exp}}$ (mg g^{-1})	Pseudo-first-order		Pseudo-second-order			
		$q_{e,\text{cal}}$ (mg g^{-1})	k_1 (1 min^{-1})	R^2	$q_{e,\text{cal}}$ (mg g^{-1})	k_2 ($\text{g mg}^{-1} \text{ min}^{-1} 10^3$)	R^2
MO	69.08	16.39	0.011	0.873	70.47	1.830	1
MB	22.64	4.96	0.010	0.854	24.40	4.320	0.998

55

56 **Text S3 Thermodynamic adsorption analysis**

57 The standard free energy change (ΔG^0) can be calculated from the following equation
58 (S5) ¹⁰:

59

60
$$\Delta G^0 = -RT \ln K^0 \quad (\text{S5})$$

61

62 where R is the universal gas constant ($8.314 \text{ J mol}^{-1}\text{K}^{-1}$), T is the temperature in
63 Kelvin. The sorption equilibrium constant, K^0 , can be calculated by plotting $\ln K_d$
64 versus C_e (Figures S4) and extrapolating C_e to zero. The standard enthalpy change
65 (ΔH^0) and the standard entropy change (ΔS^0) are calculated from the following
66 equation (S6) ¹⁰:

67
$$\ln K^0 = \frac{\Delta S^0}{R} - \frac{\Delta H^0}{RT} \quad (\text{S6})$$

68

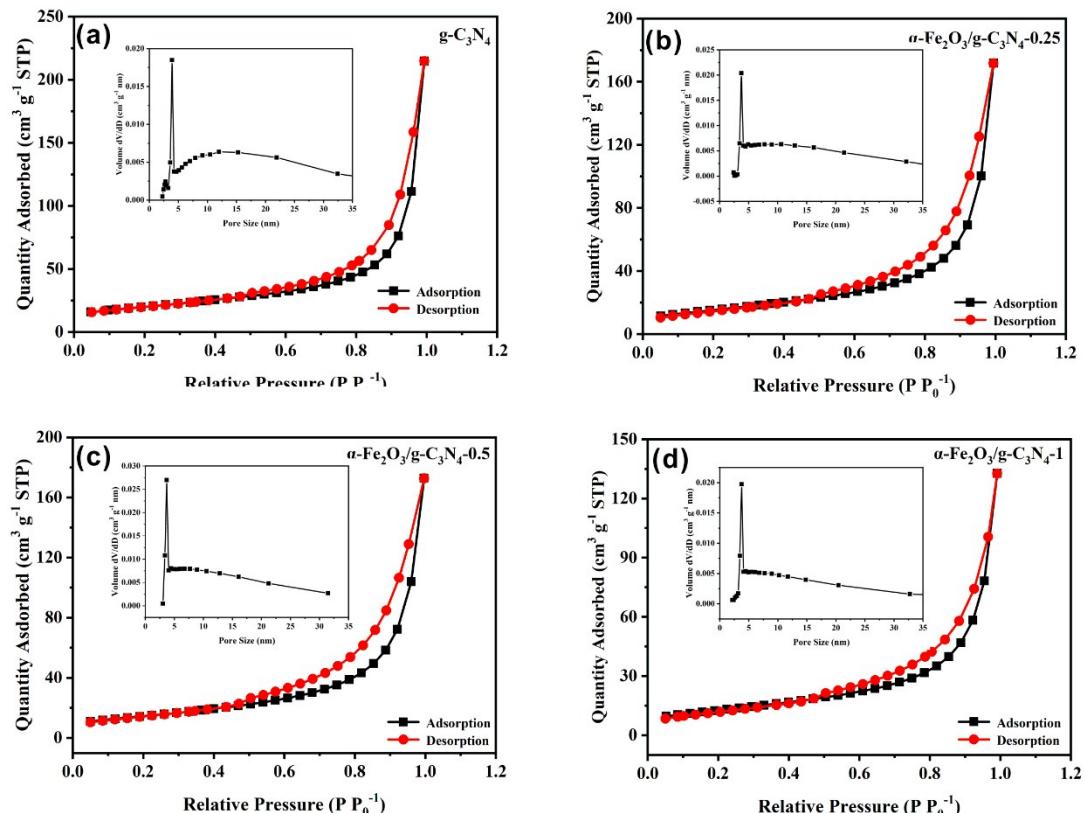

69 Linear plots of $\ln K^0$ vs $1/T$ for MO and MB adsorption on $\alpha\text{-Fe}_2\text{O}_3/\text{g-C}_3\text{N}_4\text{-}0.5$
70 are shown in Figure S5. The thermodynamic parameters are calculated from the plot
71 of $\ln K^0$ vs $1/T$ using equations (S5) and (S6).

72
73
74

75 Table S4. Thermodynamics parameters for the adsorption of MO and MB on $\alpha\text{-Fe}_2\text{O}_3/\text{g-C}_3\text{N}_4\text{-}0.5$.
76

species	ΔH^0 (kJ mol ⁻¹)	ΔS^0 (J mol ⁻¹ k ⁻¹)	ΔG^0 (kJ mol ⁻¹)		
			298K	308K	318K
MO	-17.84	-33.65	-7.89	-7.32	-7.23
MB	6.72	51.68	-8.69	-9.18	-9.73
