*Concentrations of the individual isotopes, ^{66}Zn and ^{68}Zn , were determined by ICP-MS. $^{\text{nat}}\text{Zn}$ was calculated based on natural abundance of ^{66}Zn (27.9 %). ^{68}Zn arising from decay of ^{68}Ga ($\text{decay}^{68}\text{Zn}$) was calculated by subtracting naturally occurring ^{68}Zn (18.75 %) from ^{68}Zn determined by ICP-MS.

Table SI-2. Summary of metal concentrations (determined by ICP-MS) in ^{68}Ga eluates from an E&Z generator. P-values were calculated using multiple t-tests in Prism 7 software without correction for multiple comparisons.

Metal	Mean concentration in 0.1 M HCl “blank” samples (μM)	Mean concentration in samples collected with a 2 h pre-elution (μM)	Mean difference (μM)	p-value
Al	0.282 \pm 0.054	0.606 \pm 0.467	0.323	4.3×10^{-2}
Ti	0.00248 \pm 0.00062	1.167 \pm 0.0579	1.164	$<10^{-15}$
Fe	0.021 \pm 0.012	0.0744 \pm 0.0471	0.0534	3.05×10^{-3}
