“Author Contribution Statement”

Vishal Sharma was responsible for the synthesis, non-crystallographic characterization, and manuscript preparation. Arshad Mehmood was responsible for the crystallography and manuscript preparation. Benjamin Janesko and Eric Simanek oversaw the effort.
Synthesis of compound 7 from Cyanuric Chloride:

1. 1 equiv. Glycine ethyl ester.HCl, DIPEA, THF, 0ºC-RT, 12h.
2. 1 equiv. Boc-hydrazide, 0ºC-RT, 12h.
3. 1.8 equiv. Morpholine, reflux, 20 mins.

Cyanuric chloride (5.00 g, 0.027 moles) was dissolved in 40 ml dry THF in a three neck round bottom flask equipped with stirring bar and purged with Ar. Then, glycine ethyl ester hydrochloride salt (3.8 g, 0.027 moles) and DIPEA (14.0 g, 0.104 moles) were dissolved in a mixture of 2 ml MeOH and 5 ml THF was then added to three neck flask dropwise at -20ºC. Temperature of the reaction mixture was raised slowly to 25ºC and left to stir overnight. The reaction progress was monitored via TLC. Boc-hydrazide (3.6 g, 0.027 moles) was dissolved in 5 ml THF and then added dropwise to the reaction mixture at 0ºC. Resulting solution was warmed to room temperature slowly and left to stir over night. The reaction progress was monitored via TLC. Third, morpholine (4.3 g, 0.05 moles) was added to the reaction mixture and then refluxed for 20 minutes. Excess solvent was removed under vacuum and crude product was extracted with DCM/H₂O, collected in DCM (x3). Column chromatography was performed using 1:1 mixture of Hexane and ethyl acetate to afford 7.7 g (72%) of compound 7 as white solid.

Synthesis of compound 8 (Ester hydrolysis):

Compound 7 (6.5 g, 0.0164 moles) was dissolved in 20 ml MeOH and 10 ml 5% NaOH. The resulting mixture was left to stir at 50ºC for 2 hours. MeOH was removed under vacuum and basic extraction was performed to retrieve any impurities and unreacted ester in organic layer. Aq. Layer was brought to acidic pH (5.0) using 1 M HCl was added to precipitate the acid in aq. layer. Solution was filtered to retrieve 5.9 g (98%) of compound 8 as white solid.

Figure S3: \textsuperscript{1}H-NMR of compound 8.
Coupling of 8 with amino acetaldehyde dimethyl acetal, synthesis of 1:

Compound 8 (1.0 g, 2.7 mmoles) was dissolved in a mixture of 10 ml DCM and 5 ml dry DMF in a two-neck flask equipped with stirring bar and purged with Argon. HOBT (0.54 g, 3.5 mmoles) and EDC.HCl (0.65 g, 3.6 mmoles) were dissolved in 5 ml DMF and added to flask dropwise at 0ºC. After stirring the reaction mixture for 10 minutes, 0.35 g of DIPEA was added slowly. After another 10 minutes, amino acetaldehyde dimethyl acetal (3.5 mmoles, 0.37 g) of was added dropwise to flask. Resulting solution was brought to room temperature and left to stir for 48 hours at room temperature. Excess solvent was removed under vacuum and reaction mixture was washed with water and crude product collected in DCM (x3). Crude product was further purified using column chromatography with 1:1 solvent ratio of Hexane: ethyl acetate to remove the side product of HOBT and then 25:1 solvent ratio of DCM:MeOH to retrieve 610 mg (51%) of 1 as white solid.

Figure S4: $^1$H-NMR, CDCl$_3$; δ 4.15 (2H, 2), 3.98 (2H, s), 3.85-3.72 (8H, m), 3.35 (6H, s), 1.47 (9H, s).

Coupling of 8 with amino propionaldehyde diethyl acetal, synthesis of 2:

Compound 8 (1.0 g, 2.7 mmoles) was dissolved in a mixture of 10 ml DCM and 5 ml dry DMF in a two-neck flask equipped with stirring bar and purged with Argon. HOBT (0.54 g, 3.5 mmoles) and EDC.HCl (0.65 g, 3.6 mmoles) dissolved in 5 ml DMF were added to flask dropwise at 0°C. Reaction mixture was left to stir for 10 minutes and 0.35 g of DIPEA was added slowly. After 5 minutes, amino propionaldehyde diethyl acetal (0.52 g, 3.5 mmoles) was added dropwise to flask. Resulting solution was brought to room temperature and left to stir for 48 hours at room temperature. Excess solvent was removed under vacuum and reaction mixture was washed with water and crude product collected in DCM (x3). Crude product was further purified using column chromatography with 1:1 solvent ratio of Hexane: ethyl acetate to remove the side product made by HOBT and then 25:1 solvent ratio of DCM:MeOH to retrieve 650 mg (50%) of 2 as white solid.

**Synthesis of 11 from Triazine Chloride:**

![Chemical structures](image)

In a three neck round bottom flask equipped with stirring bar and purged with argon, Cyanuric chloride (3.00 g, 0.016 moles) was dissolved in 40 ml dry THF. Beta-alanine ethyl ester hydrochloride salt (2.45 g, 0.016 moles) and DIPEA (4.3 g, 0.032 moles) were dissolved in a mixture of 2 ml MeOH and 5 ml THF and then added to flask at -20ºC. Reaction mixture was brought to room temperature slowly and left to stir overnight. The reaction progress was monitored via TLC. Boc-hydrazide (2.11 g, 0.016 moles) was dissolved in 5 ml THF and then added dropwise to the reaction mixture at 0ºC. Temperature of the resulting solution was raised slowly to room temperature and left to stir over night. After confirming the completion of reaction via TLC, excess solvent was removed under vacuum and crude product was extracted with DCM/H₂O and collected in DCM (x3). Column chromatography was performed using 1:1 mixture of Hexane and ethyl acetate to afford 5.4 g (94%) of 11 as white solid.

Figure S13: ^1^H-NMR, CDCl₃, δ 4.16-4.11 (2H, q), 3.69-3.68 (2H, m), 2.62-2.60 (2H, t), 1.45 (9H, s), 1.27-1.22 (3H, t).

Figure S13: $^1$H-NMR of compound 11

Figure S14: $^{13}$C-NMR of compound 11
Synthesis of 12 from 11:

Compound 11 (2.8 g, 0.0078 moles) was dissolved in methanol in a small flask equipped with stirring bar. To this, morpholine (810 mg, 0.00934 moles) and DIPEA (1.0 g) were added to flask. Reaction mixture was heated to 60°C and left to stir for 15 minutes. Reaction progress was monitored via TLC. After the completion of reaction 5 ml of 5% NaOH was added to reaction mixture and left to stir for one hour. Methanol was removed under vacuum and crude was extracted to remove any impurities in DCM solvent. Aqueous layer was acidified by adding acetic acid until product (acid) precipitated in the solution. Solution was filtered, washed with cold water, and dried under vacuum to retrieve 2.75 g (92%) of 12 as white solid.

Figure S15: $^1$H-NMR, CDCl$_3$/CD$_3$OD, $\delta$ 3.77-3.55 (10H, m), 2.44 (2H, m), 1.39 (9H, s).

Coupling of acid, 12, with amino acetaldehyde dimethyl acetal, synthesis of 3:

![Chemical structure](image)

Compound 12 (1.0 g, 2.6 mmoles) was dissolved in a mixture of 15 ml DCM and 3 ml dry DMF in a two-neck flask equipped with stirring bar and purged with Argon. HOBT (0.52 g, 3.4 mmoles) was added to flask dropwise at 0°C. Reaction mixture was left to stir for 10 minutes and then EDC.HCl (0.65, 3.4 mmoles) was added. After stirring for 10 minutes, amino acetaldehyde dimethyl acetal (0.33 g, 3.1 mmoles) was added dropwise to flask at 0°C. Resulting solution was brought to room temperature slowly and left to stir for 36 hours. Excess solvent was removed under vacuum and reaction mixture was washed with 0.5 M acetic acid and crude product collected in DCM (x3). Crude product was then further washed with saturated NaHCO₃ to remove any unreacted acid intermediate. Crude product was further purified using column chromatography with 1:1 solvent ratio of Hexane: ethyl acetate to remove the side product made by HOBT and then 25:1 solvent ratio of DCM:MeOH to retrieve 3 (580 mg, 56%) as white solid.

Coupling of acid, 12, with amino propionaldehyde diethyl acetal, synthesis of 5:

![Chemical structure](image)

Compound 12 (700 mg, 1.8 mmoles) was dissolved in a mixture of 12 ml DCM and 3 ml dry DMF in a two-neck flask equipped with stirring bar and purged with Argon. HOBT (0.29 g, 1.9 mmoles) was added to flask dropwise at 0°C. Reaction mixture was left to stir for 10 minutes and then EDC.HCl (0.36 g, 1.9 mmoles) was added. After another 10 minutes, amino propionaldehyde diethyl acetal (0.18g, 1.9 mmoles) was added dropwise to flask at 0°C. Resulting solution was brought to room temperature slowly and left to stir for 24 hours at room temperature. Excess solvent was removed under vacuum and reaction mixture was washed with 0.5 M acetic acid and crude product collected in DCM (x3). Crude product was then further washed with saturated NaHCO₃ to remove any unreacted acid intermediate. Crude product was further purified using column chromatography with 1:1 solvent ratio of Hexane: ethyl acetate to remove the side product made by HOBT and then 25:1 solvent ratio of DCM:MeOH to retrieve 5 (510 mg, 55%) as white solid.

Coupling of acid, 12, with 1-amino-4,4-diethoxybutane, synthesis of 6:

Compound 12 (920 mg, 2.4 mmoles) was dissolved in a mixture of 15 ml DCM and 3 ml dry DMF in a two-neck flask equipped with stirring bar and purged with Argon. HOBT (0.44 g, 2.8 mmoles) was added to flask dropwise at 0ºC and resulting reaction mixture was left to stir for 10 minutes. Then, EDC.HCl (2.8 mmoles, 0.55 g) was added. After 10 minutes, amino butanaldehyde diethyl acetal (2.8 mmoles, 0.47 g) was added dropwise to flask at 0ºC. Resulting solution was brought to room temperature slowly and left to stir for 24 hours at room temperature. Excess solvent was removed under vacuum and reaction mixture was washed with 0.5 M acetic acid and crude product collected in DCM (x3). Crude product was then further washed with saturated NaHCO₃ to remove any unreacted acid intermediate. Crude product was further purified using column chromatography with 1:1 solvent ratio of Hexane: ethyl acetate to remove the side product made by HOBT and then 25:1 solvent ratio of DCM:MeOH to retrieve 6 (520 mg, 42%) as white solid.

Synthesis of 13 from Triazine Chloride

In a small three-neck flask equipped with stirring bar and purged with argon, 1.0 g (5.4 mmoles) of cyanuric chloride was dissolved in 30 ml THF. Two equivalent DIPEA (1.40 g, 10.8 mmoles) was added to the solution. One equivalent tert-butyl carbazate (0.72 g, 5.4 mmoles) dissolved in 10 ml THF was added to reaction mixture at 0°C and resulting solution was brought to room temperature slowly and left to stir overnight at room temperature. Reaction progress was monitored by TLC. Once the reaction was complete, one equivalent morpholine (0.473 g, 5.4 mmoles) was added dropwise to reaction solution at -30°C. Resulting solution was brought to room temperature and left to stir overnight. Excess solvent was removed under vacuum, re-dissolved in DCM, washed with water, dried over brine, and finally chromatographic purifications were done using 2:1 hexane: ethyl acetate solution to afford 13 (1.61 g, 91%) as white solid.

Figure S26: $^1$H-NMR, CDCl$_3$; δ 7.97 (1H, s), 6.55 (1H, s), 3.82-3.71 (8H, m), 1.47 (9H, s).

Figure S26: $^1$H-NMR of 13

Figure S27: $^{13}$C-NMR of 13
Synthesis of 14 from 13

In a small round bottom flask purged with nitrogen, compound 13 (50 mg, 0.15 mmoles) was dissolved in dry THF. One equivalent sodium hydride (3.7 mg, 0.15 mmoles) was added to flask at 0°C. After about 10 minutes, methyl iodide (43 mg, 0.30 mmoles) was added to the solution. Reaction mixture was brought to room temperature and left to stir for 2 hours. Excess solvent removed, re-dissolved in DCM, washed with water and further purified by column chromatography using 2:1 hexane: ethyl acetate solvent system to afford 14 (31 mg, 60%) as white solid.

Figure S28: $^1$H-NMR, CDCl$_3$; $\delta$ 3.82-3.71 (8H, m), 3.40-3.36 (3H, s), 1.47 (9H, s).

Figure S28: $^1$H-NMR of 14

Figure S29: $^{13}$C-NMR of 14
Synthesis of 15 from 14

Compound 14 (30 mg, 0.087 mmoles) was dissolved in 2 ml dioxane in a 5 ml round bottom flask. DIPEA (0.5 ml) and glycine ethyl ester (24 mg, 0.17 mmoles) was added to reaction mixture and resulting solution was refluxed for 12 hours. Excess solvent was removed under vacuum and purified by column chromatography using 1:1 hexane: ethyl acetate solution mixture to yield 15 (26 mg, 74%) as white solid.

Figure S30: $^1$H-NMR, CDCl$_3$; $\delta$ 5.51 (1H, m), 4.23-4.18 (2H, q), 4.13-4.10 (2H, d), 3.74-3.67 (8H, m), 3.30 (3H, s), 1.47 (9H, s), 1.29-1.26 (3H, t).

Figure S30: $^1$H-NMR of 15

Figure S31: $^{13}$C-NMR of 15
Synthesis of 16 from 15 by direct amidation of ester

In a small flask equipped with stirring bar and purged with argon, 21 mg (0.051 mmoles) of 14 was dissolved in 2 ml methanol. DIPEA (0.5 ml) was added followed by the addition of amino butanaldehyde diethyl acetal (17 mg, 0.12 mmoles). Resulting solution was left to stir for 4 days at room temperature. Product formation was determined by the TLC. After completion of the reaction, excess solvent was removed and crude product was re-dissolved in DCM and washed with water. After removing excess DCM, crude product was further purified by column chromatography using 25:1 solvent ratio of DCM:MeOH to retrieve 7 (20 mg, 74%) as white solid. Compound 16 was used to make macrocycle 10 without further characterization. Rf value of 16 was lower than that of 15 and taken as the evidence of product formation.
**Synthesis of model compound 17**

Compound **16** (200 mg, 0.52 mmoles) was dissolved in 10 ml methanol in small three neck flask equipped with stirring bar and purged with argon. Methyl amine (40 mg, 1.3 mmoles) was added to the reaction flask. Resulting solution was stirred overnight at room temperature for 4 days. Excess solvent was removed and solution was extracted with 0.5 M acetic acid and crude product was recovered in DCM. Crude product was further purified by column chromatography using dichloromethane and methanol (25:1) to recover compound **17** (128 mg, 62%) as white solid.

Figure S32: $^1$H-NMR, CDCl$_3$; $\delta$ 3.85-3.69 (10H, m), 3.33 (3H, s), 2.55 (2H, m), 1.46 (9H, s).

---

42
Synthesis of model compound 18

Acetic anhydride (10 ml) and amino propionaldehyde diethyl acetal (1.1 g, 7.4 mmoles) was mixed in a small flask equipped with stirring bar. To the reaction solution, 0.5 ml triethyl amine (TEA) was added and solution was left to stir at room temperature for 12 hours. Reaction progress was measured by TLC. 5 ml of 10% NaOH was added to the reaction mixture and refluxed for 30 minutes. Reaction mixture was extracted using ethyl acetate and water, product was recovered in ethyl acetate and purified by column chromatography using 2:1 hexane: ethyl acetate as solvent system to afford 18 (1.26 g, 89%) as slightly yellow liquid.

Figure S33: $^1$H-NMR, CDCl$_3$; $\delta$ 6.23 (1H, s), 4.59-4.57 (2H, q), 3.73-3.67 (2H, d), 3.66-3.50 (2H, m), 3.38-3.35 (2H, t), 2.08 (3H, s), 1.97-1.85 (2H, q), 1.25-1.22 (6H, t).

Figure S4: $^{13}$C-NMR of 18
Synthesis of Macrocycle-1*1 from 1:

Compound 1 (220 mg, 0.35 mmoles) was dissolved in a 3 ml DCM in a small flask equipped with stirring bar. 3 ml of TFA was added to the reaction mixture and resulting solution was left to stir at room temperature for 48 hours or until all solvents (DCM & TFA) had evaporated. Crude product was then washed with 3 ml DCM (x2) and filtered. The precipitates were then washed with 0.5 ml MeOH (x2). Excess MeOH should be avoided as macrocycle dissolve sparingly in MeOH at room temperature. Precipitates were dried under vacuum to afford macrocycle 1*1 (130 mg, 93%) as white solid.

Figure S35: $^1$H-NMR, DMSO-$d_6$; δ 12.62 (1H, s), 8.44-8.42 (1H, t), 8.24-8.22 (1H, t), 7.63 (1H, s), 4.21-4.20 (H, d), 4.13-4.12 (2H, d), 3.84-3.66 (8H, m).

Symmetry codes: (i) $x-1$, $y$, $z+1$;
Figure S72: Mass spectrum of macrocycle 4*4.

Figure S73: HPLC chromatogram of 4*4.
Synthesis of 5*5 from 5:

Compound 5 (20 mg, 0.039 mmoles) was dissolved in a mixture of 1 ml DCM and 1 ml TFA in a small flask equipped with stirring bar. Reaction mixture and resulting solution was left to stir at room temperature for 48 hours. Crude product was not washed with DCM or MeOH and dried as it to yield 5*5 (12 mg, 97%) as white solid. NMR of crude product was taken as it without further purifications.

Figure S85: HPLC chromatogram of 5*5.
Synthesis of 3\(\times\)3, 3\(\times\)5, and 5\(\times\)5 from one to one mole ratio of 3 and 5:

Compound 3 (90 mg, 0.192 mmoles) and compound 5 (98 mg, 0.192 mmoles) were dissolved in equal mixture of 2 ml of DCM and 2 ml of TFA in a small flask. Solution was left to stir for 24 hours at room temperature. Mass spectrum of crude product indicate the formation of 3\(\times\)3, 3\(\times\)5, and 5\(\times\)5. In addition, their formation was confirmed by HPLC analysis.

Figure S86: HPLC chromatogram of a mixture of 3\(\times\)3, 3\(\times\)5, and 5\(\times\)5.
Synthesis of 6*6 from 6:

Compound 6 (150 mg, 0.29 mmoles) was dissolved in a 3 ml DCM and 3 ml TFA in a small flask equipped with stirring bar. Resulting solution was left to stir at room temperature for 48 hours or until it was completely dried. Crude product was then washed with 1 ml DCM (x2) and filtered. The precipitates were then washed with 0.3 ml MeOH (x2). Excess MeOH should be avoided as macrocycle dissolve sparingly in MeOH at room temperature. Precipitates were air dried to afford of 6*6 (85 mg, 86%) as white solid.

Synthesis of macrocycle 10 from 16

Compound 16 (20 mg, 0.038 mmoles) was dissolved in a 2 ml DCM and 2 ml TFA in a small flask equipped with stirring bar. Resulting solution was left to stir at room temperature for 48 hours or until it was completely dried. Crude product was then washed with 1 ml DCM (x2) and filtered. Precipitates were dried under vacuum to afford macrocycle 10 (11 mg, 87%) as white solid.

Synthesis of model imine 9 from 17 and N-acetyl propionaldehyde acetal (18)

Compound 17 (20 mg, 0.049 mmoles) and 18 (9.3 mg, 0.049 mmoles) were dissolved in 2 ml DCM and 2 ml TFA. Resulting reaction mixture was left to stir at room temperature for more than 24 hours until the solvents were evaporated. No purification were required and the NMR of the crude product was taken.

Figure S100: $^1$H-NMR, DMSO-$d_6$; $\delta$ 12.36 (1H, s), 11.55 (1H, s), 8.14-8.13 (1H, t), 8.07-8.04 (1H, t), 7.56-7.55 (1H, t), 3.83-3.57 (10H, m), 3.31-3.26 (2H, q), 2.61-2.59 (3H, d), 2.51-2.41 (4H, m), 1.80 (3H, s)

Figure S102: COSY-NMR of macrocycle 9 in DMSO-$d_6$
Figure S103: NOESY-NMR of macrocycle 9 in DMSO-$d_6$
Synthesis of mixture of 14-21 macrocycles:

Compounds 1-6 in equal moles (1 (40 mg, 0.09 mmoles), 2 (43.7 mg), 3 (41.2 mg), 4 (45 mg), 5 (45 mg), and 6 (46.1 mg)) were dissolved in 5 ml DCM and 5 ml TFA. The resulting solution was left to stir at room temperature for more than 48 hours. No purification was done and HPLC was run of the crude sample. HPLC chromatogram shows the formation of at least 14 products. However, identification of the peaks is an undergoing investigation.

Figure S104: HPLC chromatogram of mixture of macrocycles.
X-ray diffraction analysis
The X-ray diffraction data sets of macrocycles 1*1, 2*2, 3*3, 4*4 and 6*6 were collected on a Bruker D8 Quest diffractometer equipped with a Photon 100 CMOS detector with Kα radiation (λ = 0.71073 Å). The suitable crystal of each macrocycle was mounted on the goniometer head using Paratone-N oil on the tip of MiTeGen MicroLoops LD™, at appropriate distance from the detector. The exposure time of 15 second was selected in shutter-less mode with a scan angle of 0.75° per frame while generator operating at 50 kV and 30 mA. The Bragg intensities of data sets consisting of ω and φ scans were indexed using APEX3 package¹ whereas the data reduction and absorption corrections were carried out with the SAINT² and SADABS³ packages respectively. The space group was determined using XPREP¹ through analysis of the Laue symmetry and systematic absences. Structures were solved by the intrinsic phasing method using the SHELXT⁴ software. The solution of each compound with the best figure of merit revealed the coordinates of all non-hydrogen atoms which were refined using SHELXL⁵ program embedded in the OLEX2 package⁶. The hydrogen atoms were located by the difference Fourier analysis and during the structure refinement, the atomic displacement parameters of hydrogen atoms were treated isotropically and non-hydrogen atoms were anisotropically refined using the full-matrix least squares procedure on $F^2$ (using all data). The hydrogen atoms attached to the carbon atoms were allowed to ride on their carrying atoms, whereas those attached to heteroatoms were refined freely. During the refinement of disorders, the sum of the occupancies of the two disordered parts were fixed to unity. The correlation of the thermal parameters was avoided by constraining the atomic displacement parameters (ADPs) of both parts to be equal during refinement.
