Product analysis

FD (furfuraldehyde), FA (furfuryl alcohol), and other liquid substrates conversion and products yield were quantitatively analysed by gas chromatography (GC, Techcomp 7900) with a FID (flame ionization detector) using decane as the GC internal standard. The products were identified by GC-MS (Agilent 7890B-7000D). The conversion of substrates (e.g., FD) and yields of products (e.g., FA) were calculated based on standard curves ($R^2 \geq 0.9994$) of corresponding commercial samples in five gradient concentrations along with a certain amount of internal standard (decane).^{1, 2} Substrate conversion (Conv, %), product yield (Yield, %) and selectivity (Sel, %) were calculated using the following equations:

$$\text{Conv (\%)} = [1 - (\text{mole of substrate after reaction}) / (\text{mole of initial substrate})] \times 100 \%$$

$$\text{Yield (\%)} = (\text{mole of the obtained product}) / (\text{the theoretical mole of the product under total conversion of the initial substrate}) \times 100 \%$$

$$\text{Sel (\%)} = (\text{product yield}) / (\text{substrate conversion}) \times 100 \%$$

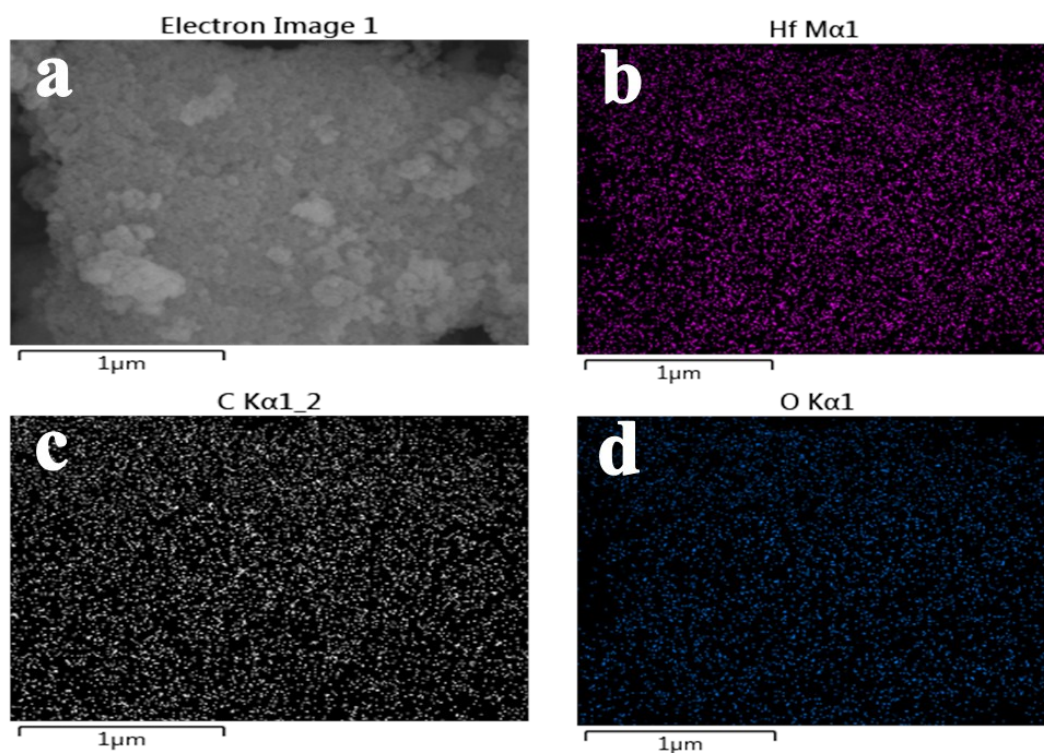

Figure S1 Element mapping images of Hf-TA: (a) scanning range of the EDS mapping, (b) Hf element, (c) C element, and (d) O element.

Table S1 CTH reaction of FD to produce FA catalyzed by various catalysts.^a

<chem>C1=CC=C(C=C1)C=O >> C1=CC=C(C=C1)CO</chem> 2-PrOH catalyst				
Entry	Catalyst type	Conv. (%)	Yield. (%)	Sel. (%)
1	Hf-TA	97.2	96.2	98.9
2	Zr-TA	62.6	45.4	72.5
3	Al-TA	19.4	7.8	40.2
4	Cr-TA	14.7	4.1	27.9
5	Sn-TA	12.1	6.8	56.2
6	Fe-TA	4.9	4.3	87.7
7	Cu-TA	4.8	3.3	68.8
8	HfCl ₄	60.3	3.6	5.9
9	HfO ₂	20.0	4.0	20.0
10	Hf(OH) ₄	4.0	1.0	25.0

^a Typical reaction conditions were as follows except otherwise stated in the table: FD 1 mmol, 2-PrOH 5 mL, catalyst 200 mg, reaction temperature 70 °C, reaction time 5 h

Figure S2 SEM image (a) and TEM image (b) of the recycled Hf-TA catalyst after 10 cycles.

Figure S3 XRD patterns (a) and nitrogen adsorption-desorption isotherms (b) of the fresh Hf-TA and recycled Hf-TA catalyst after 10 cycles.

Table S2 Surface area, volume and Hf content of different catalysts.

Catalyst	S_{BET} (m^2/g) ^a	V_{pore} (cm^3/g) ^b	D_{mean} (nm) ^c	P_{size} (nm) ^d	ICP_{Hf} (%) ^e
Fresh Hf-TA	87.8	0.2	12.9	68.4	35.3
Reused Hf-TA ^f	66.0	0.2	17.6	90.9	34.5

^a S_{BET} : BET surface area was obtained from N_2 adsorption isotherm. ^b V_{pore} : Volume of pores. ^c D_{mean} : Adsorption average pore diameter. ^d P_{size} : Average particle size. ^e ICP_{Hf} : ICP-OES detected hafnium content. ^f Hf-TA: Used Hf-TA after 10 cycles.

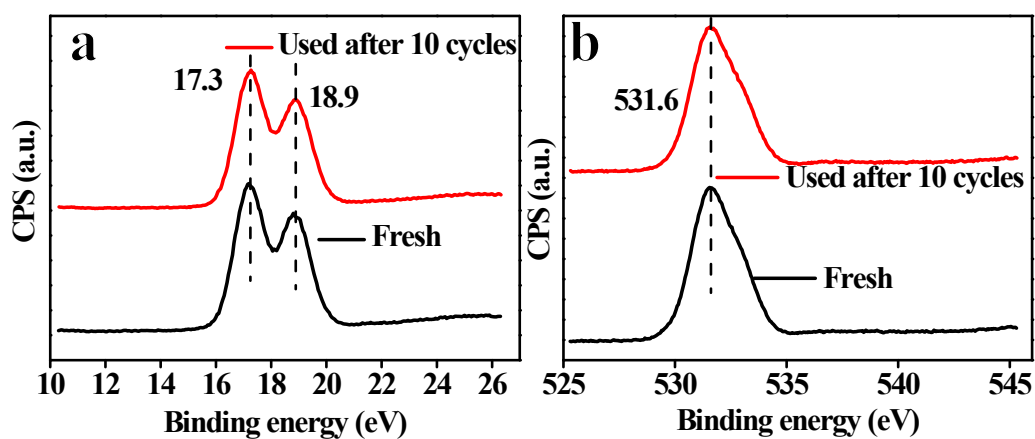

Figure S4 XPS spectra of Hf 4f (a) and O 1s (b) in the fresh Hf-TA and recycled Hf-TA catalyst after 10 cycles.

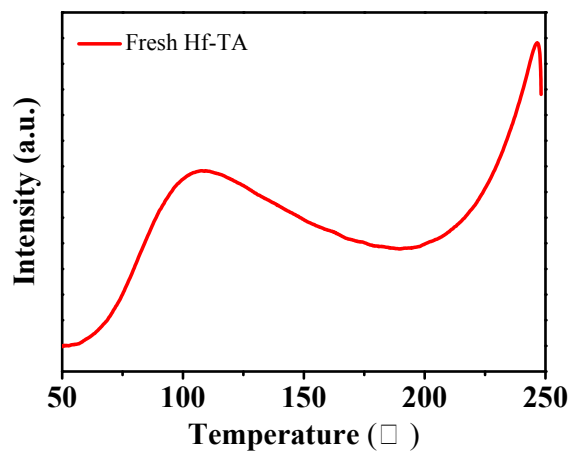

Figure S5 NH₃-TPD spectra of Hf-TA. Due to the decomposition temperature of the as-prepared catalyst was about 250 °C, the test could conduct under the temperature lower than 250 °C.
