**Table S1.** Chemical composition of the hierarchically porous carbons.

| Sample code | Elemental composition (wt.%) |     |     |     |     | (O/C) <sub>at</sub> <sup>a</sup> |
|-------------|------------------------------|-----|-----|-----|-----|----------------------------------|
|             | C                            | H   | N   | S   | O   |                                  |
| CK-750      | 90.9                         | 0.2 | 0.1 | 0.0 | 8.9 | 0.07                             |
| CK-800      | 93.2                         | 0.2 | 0.1 | 0.0 | 6.5 | 0.05                             |
| CK-850      | 93.8                         | 0.1 | 0.2 | 0.0 | 6.1 | 0.05                             |
| CK-900      | 93.5                         | 0.1 | 0.3 | 0.0 | 6.2 | 0.05                             |

<sup>a</sup> O/C atomic ratio.

**Table S2.** Textural properties and yield of tannic acid-derived carbons produced by a variety of conditions.

| Sample code | Activating agent/template<br>(wt. ratio) <sup>a</sup>                   | Textural properties                                |   |   | Yield <sup>b</sup> (%) |
|-------------|---|--|---|---|------------------------|
|             |   | S <sub>BET</sub> (m <sup>2</sup> g <sup>-1</sup> ) | V <sub>Total</sub> (cm <sup>3</sup> g <sup>-1</sup> ) | V <sub>&lt;2nm</sub> (cm <sup>3</sup> g <sup>-1</sup> ) |                        |
| TK          | -/KCl (0/6.7)   | 510  | 0.48  | 0.16  | 26.1                   |
| CK          | K <sub>2</sub> CO <sub>3</sub> - (1/0)                                  | 1770   | 0.86  | 0.64  | 35.2                   |
| BK          | KHCO <sub>3</sub> /KCl (1/6.7)  | 2180   | 0.91  | 0.82  | 36.3                   |
| OK          | K <sub>2</sub> C <sub>2</sub> O <sub>4</sub> /KCl (1/6.7)               | 1990   | 0.84  | 0.72  | 38.7                   |
| CK-N        | K <sub>2</sub> CO <sub>3</sub> /NaCl (1/6.7)                            | 1890   | 0.91  | 0.69  | 35.0                   |
| CK-C        | K <sub>2</sub> CO <sub>3</sub> /Na <sub>2</sub> CO <sub>3</sub> (1/6.7) | 1830   | 0.95  | 0.68  | 32.4                   |
| CK-F        | K <sub>2</sub> CO <sub>3</sub> /KCl (1/6.7)                             | 2340   | 0.98  | 0.86  | 36.1                   |
| CK-M        | K <sub>2</sub> CO <sub>3</sub> /KCl (1/6.7)                             | 2130   | 0.87  | 0.78  | 35.2                   |

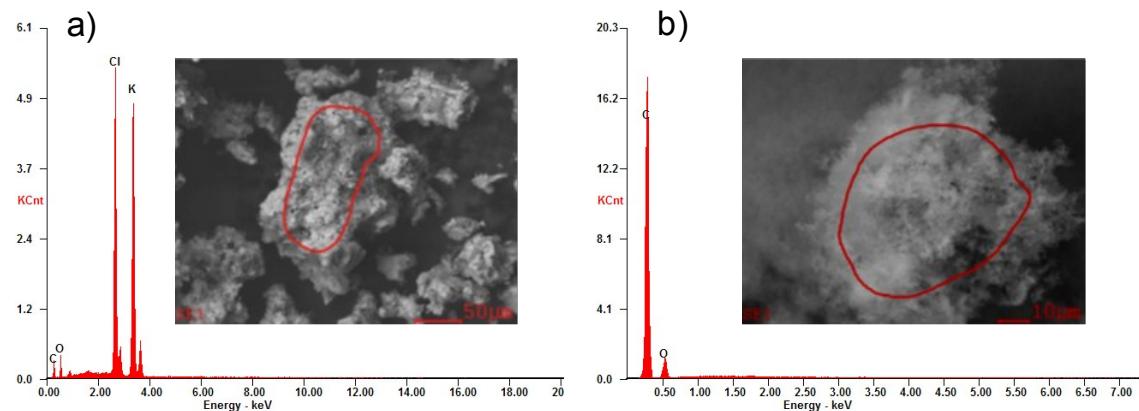

<sup>a</sup> Weight ratio with respect to 1 part of tannic acid.

<sup>b</sup> Yield calculated by dividing the weight of porous carbon by the weight of tannic acid in the mixture prior to pyrolysis.

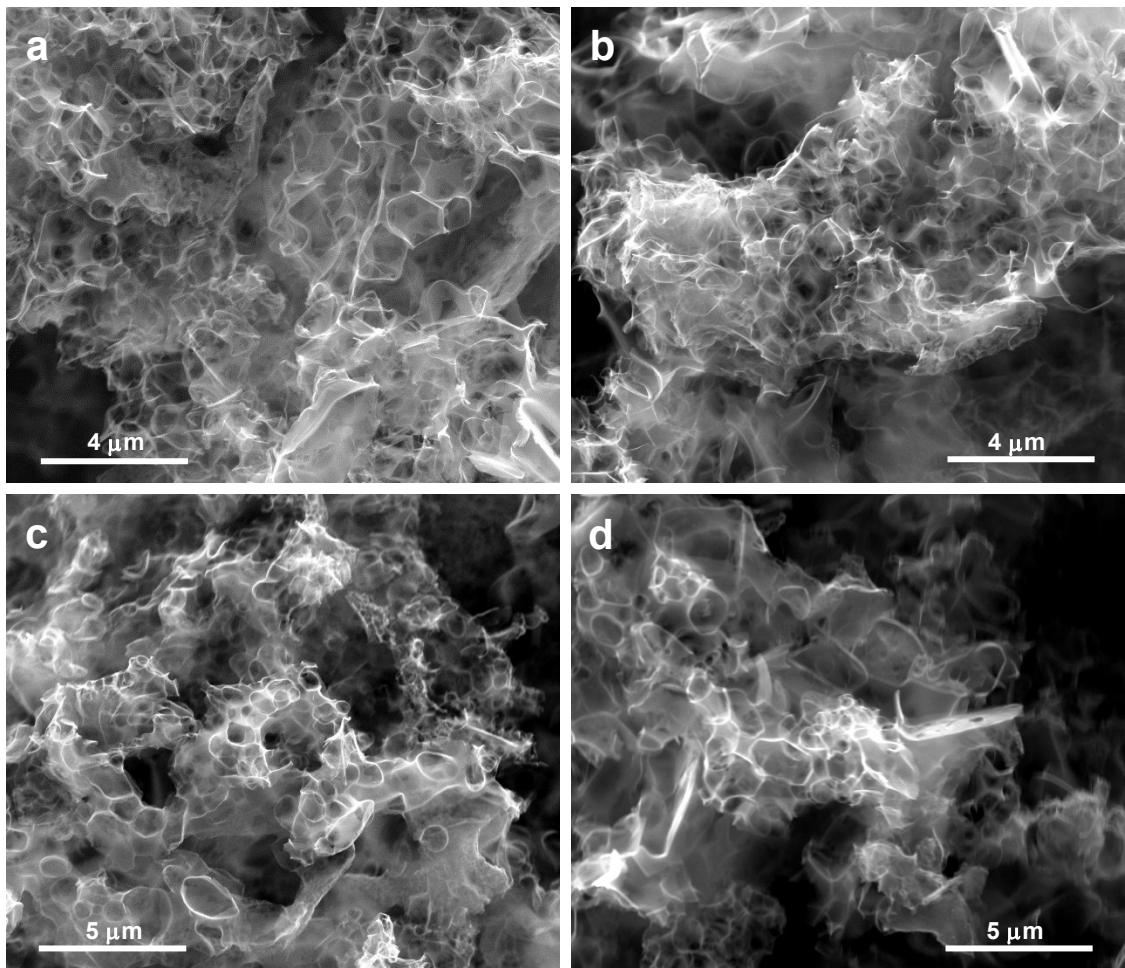

**Table S3.** Textural properties and carbon yield of porous carbons obtained by using different biomass-based carbon precursors and activating agents.

| Carbon precursor  | Activating agent                 | Textural properties                          |   | Carbon yield <sup>a</sup> (%) | Reference   |
|-------------------|----------------------------------|--|---|-------------------------------|-------------|
|                   |                                  | $S_{\text{BET}} (\text{m}^2 \text{ g}^{-1})$ | $V_{\text{Total}} (\text{cm}^3 \text{ g}^{-1})$ |                               |             |
| Tannic acid       | $\text{K}_2\text{CO}_3$          | 2740   | 1.39  | 32.1                          | [This work] |
| Lignin            | $\text{K}_2\text{CO}_3$          | 1950   | 0.93  | 39.0                          | [37]        |
| Waste tea         | $\text{K}_2\text{CO}_3$          | 1722   | 0.95  | 15.9                          | [40]        |
| Coconut shell     | $\text{K}_2\text{CO}_3$          | 1430   | 0.65  | 48.0                          | [41]        |
| Chickpea husk     | $\text{K}_2\text{CO}_3$          | 1780   | 0.65  | 13.0                          | [42]        |
| Palm shell        | $\text{K}_2\text{CO}_3$          | 1170   | -   | 19.0                          | [43]        |
| Rice husks        | $\text{K}_2\text{CO}_3$          | 1165   | 0.78  | 14.2                          | [44]        |
| Tobacco stems     | $\text{K}_2\text{CO}_3$          | 2557   | 1.65  | 16.7                          | [45]        |
| Tannin-F hydrogel | KOH                              | 1800   | 0.65  | 21.0                          | [31]        |
| Sugar cane pulp   | KOH                              | 2910   | 2.05  | 11.0                          | [7]         |
