**Table S3.** ICP-AES results of electrode samples.

<i>Theoretical chemical formulae</i>	<i>Information of the electrodes</i>	<i>ICP-AES Na : Mg : V : Cr : P</i>
$\text{Na}_3\text{VCr}(\text{PO}_4)_3$	Original NVCP material	2.96 : 0 : 1.01 : 0.97 : 3
$\text{Na}_{1.5}\text{VCr}(\text{PO}_4)_3$	After first charge in Na cell (1M $\text{NaClO}_4$ in PC)	1.54 : 0 : 0.98 : 0.96 : 3
$\text{Na}_{1.5}\text{Mg}_{0.75}\text{VCr}(\text{PO}_4)_3$	After first discharge in Mg cell* (0.5 M $\text{Mg}(\text{TFSI})_2$ in DME)	1.53 : 0.68 : 0.99 : 0.98 : 3

\*The NVCP electrode was charged in Na cell at  $-15^\circ\text{C}$  to remove the  $\text{Na}^+$  ions. Afterwards, the electrode was washed with DME (1,2-dimethoxyethane) to remove all  $\text{Na}^+$  ions from the electrolyte. Eventually, the electrode is assembled in Mg cell at  $-15^\circ\text{C}$  and discharged to reach 85 mAh/g.

## ICP Results:

## Measurement data for original NVCP material
