## The first X-ray crystal structure determination of a dinuclear complex trapped in the [low spin-high spin] state: $\left[\mathrm{Fe}^{\mathrm{II}}{ }_{2}\left(\mathrm{PMAT}_{2}\right]\left(\mathrm{BF}_{4}\right)_{4} \cdot\right.$ DMF

Marco H. Klingele, Boujemaa Moubaraki, John D. Cashion, Keith S. Murray* and Sally Brooker*

## Experimental:

Preparation of $\left[\mathrm{Fe}_{2}{ }_{2}\left(\mathrm{PMAT}_{2}\right]\left(\mathrm{BF}_{4}\right)_{4}\right.$ (1): A colourless solution of $\mathrm{Fe}\left(\mathrm{BF}_{4}\right)_{2} \cdot 6 \mathrm{H}_{2} \mathrm{O}(84 \mathrm{mg}, 0.25 \mathrm{mmol})$ in MeCN $(5 \mathrm{~mL})$ was added dropwise to a colourless solution of PMAT $^{17}$ ( $81 \mathrm{mg}, 0.25 \mathrm{mmol}$ ) in MeCN ( 10 mL ). The resulting red solution was stirred at room temperature for 1 hour during which time the product precipitated from the reaction mixture. The solid was filtered off and washed with MeCN and $\mathrm{Et}_{2} \mathrm{O}$. Drying in vacuo gave 105 $\mathrm{mg}(76 \%)$ of $\left[\mathrm{Fe}_{2}{ }_{2}(\mathrm{PMAT})_{2}\right]\left(\mathrm{BF}_{4}\right)_{4}$ as a pale yellow powder. Elemental analysis (\%) calcd. for $\mathrm{C}_{32} \mathrm{H}_{40} \mathrm{~B}_{4} \mathrm{~F}_{16} \mathrm{Fe}_{2} \mathrm{~N}_{16}\left(1107.69 \mathrm{~g} \mathrm{~mol}^{-1}\right): \mathrm{C} 34.70, \mathrm{H} 3.64, \mathrm{~N}$ 20.23; found C 34.68, H $3.50, \mathrm{~N} 19.89$. IR (KBr): $v / \mathrm{cm}^{-1}$ $=3125,2916,1607,1570,1558,1489,1438,1375,1306$, 1239, 1083, 1036, 891, 816, 766, 730, 668, 645, 538, 521, 467. ESI-MS (pos., MeCN): $m / z=163.4\left[(\mathrm{PMAT}) \mathrm{H}_{2}\right]^{2+}$, $325.3 \quad[(\mathrm{PMAT}) \mathrm{H}]^{+}, \quad 352.2 \quad\left[\mathrm{Fe}(\mathrm{PMAT})_{2}\right]^{2+}, \quad 413.2$ $\left[(\mathrm{PMAT})\left(\mathrm{BF}_{4}\right) \mathrm{H}_{2}\right]^{+}, \quad 790.6 \quad\left[\mathrm{Fe}(\mathrm{PMAT})_{2}\left(\mathrm{BF}_{4}\right)\right]^{+}, \quad 879.5$ $\left[\mathrm{Fe}(\mathrm{PMAT})_{2}\left(\mathrm{BF}_{4}\right)_{2} \mathrm{H}\right]^{+}$. Molar conductivity (DMF): $\Lambda_{\mathrm{m}} /$ $\Omega^{-1} \mathrm{~cm}^{2} \mathrm{~mol}^{-1}=224$.

Magnetic susceptibility studies were carried out on $\mathbf{1} \cdot \mathbf{D M F}$ using a Quantum Design MPMS SQUID magnetometer with an applied field of 1 T . The polycrystalline sample was contained in a calibrated gelatine capsule which was held in the centre of a soda straw fixed to the end of the sample rod. The magnetic data were also measured with the sample dispersed in a Vaseline mull to eliminate any crystallite orientation effects often evident as anomalous $\mu_{\text {eff }} v s$. $T$ plots in orbitally degenerate systems such as octahedral $\mathrm{Fe}^{\mathrm{II}}$. None was evident here. The magnetisation values of the instrument were calibrated against a standard palladium sample, supplied by Quantum Design, and also against chemical calibrants such as $\mathrm{CuSO}_{4} \cdot 5 \mathrm{H}_{2} \mathrm{O}$ and $\left[\mathrm{Ni}(\mathrm{en})_{3}\right]\left(\mathrm{S}_{2} \mathrm{O}_{3}\right)$.

The Mössbauer spectrum was obtained using a conventional constant acceleration drive with a symmetrical sawtooth waveform. The source of ${ }^{57} \mathrm{Co}$ in rhodium was maintained at room temperature. The iron complex was loaded into a piston type Perspex holder. The holder was placed in a cold-finger type cryostat in good thermal contact with the reservoir which contained liquid nitrogen. Drive calibration was carried out using an $\alpha$-Fe foil and isomer shifts are quoted relative to $\alpha-\mathrm{Fe}$ at room temperature. The spectrum was fitted to Lorentzian lines, with the matching lines of a doublet constrained to have the same intensity and linewidth.

X-Ray data were collected at 123 and 298 K on a $0.25 \times$ $0.30 \times 0.40 \mathrm{~mm}^{3}$ prism of $\mathbf{1} \cdot \mathbf{D M F}\left(\mathrm{C}_{35} \mathrm{H}_{47} \mathrm{~B}_{4} \mathrm{~F}_{16} \mathrm{Fe}_{2} \mathrm{~N}_{17} \mathrm{O}\right)$, obtained by evaporation of a $4: 1 \mathrm{MeCN} / \mathrm{DMF}$ solution, using a Nonius Kappa CCD diffractometer with graphitemonochromated $\mathrm{Mo}-\mathrm{K} \alpha$ radiation. Extensive hydrogen bonding, between the hydrogen atoms on the nitrogen atoms of PMAT and the $\mathrm{BF}_{4}^{-}$anions and DMF solvate, is present in both structures. CCDC 247510 and 247511 contain the supplementary crystallographic data for this paper. These data can be obtained online free of charge from http://www.ccdc.cam.ac.uk/conts/retrieving.html [or from the Cambridge Crystallographic Data Centre, 12 Union Road, Cambridge CB2 1EZ, UK; fax: (+44) 1223-336-033; e-mail: deposit@ccdc.cam.ac.uk].

Fig. S1 Perspective view of $\mathbf{1} \cdot \mathbf{D M F}$ at 298 K . The $\mathrm{BF}_{4}{ }^{-}$anions, the DMF solvate and all hydrogen atoms, except those bonded to nitrogen atoms, have been omitted for clarity. Symmetry operation used to generate equivalent atoms: $(\mathrm{A})-\mathrm{x},-\mathrm{y}+1,-\mathrm{z}+1$.
