## Supporting Information

General. Chemicals and solvents were either purchased puriss p.A. from commercial suppliers or purified by standard techniques. For thin-layer chromatography (TLC), silica gel plates Merck 60 F254 were used and compounds were visualized by irradiation with UV light and/or by treatment with a solution of phosphomolybdic acid ( 25 g ), $\mathrm{Ce}\left(\mathrm{SO}_{4}\right)_{2} \cdot \mathrm{H}_{2} \mathrm{O}(10 \mathrm{~g})$, conc. $\mathrm{H}_{2} \mathrm{SO}_{4}(60 \mathrm{~mL})$, and $\mathrm{H}_{2} \mathrm{O}(940 \mathrm{~mL})$ followed by heating or by treatment with a solution of $p$-anisaldehyde ( 23 mL ), conc. $\mathrm{H}_{2} \mathrm{SO}_{4}(35 \mathrm{~mL})$, acetic acid $(10 \mathrm{~mL})$, and ethanol ( 900 mL ) followed by heating. Flash chromatography was performed using silica gel Merck 60 (particle size $0.040-0.063 \mathrm{~mm}$ ), ${ }^{1} \mathrm{H}$ NMR and ${ }^{13} \mathrm{C}$ NMR spectra were recorded on Varian AS 400 . Chemical shifts are given in $\delta$ relative to tetramethylsilane (TMS), the coupling constants $J$ are given in Hz. The spectra were recorded in $\mathrm{CDCl}_{3}$ as solvent at room temperature, TMS served as internal standard ( $\delta=$ 0 ppm ) for ${ }^{1} \mathrm{H}$ NMR, and $\mathrm{CDCl}_{3}$ was used as internal standard ( $\delta=77.0 \mathrm{ppm}$ ) for ${ }^{13}$ C NMR. GC was carried out using a Varian 3800 GC Instrument. Chiral GC-column used: CP-Chirasil-Dex CB $25 \mathrm{~m} \times 0.32 \mathrm{~mm}$. Optical rotations were recorded on a Perkin Elemer 241 Polarimeter ( $\lambda=589 \mathrm{~nm}, 1 \mathrm{dm}$ cell). Optical rotations were recorded on a Perkin Elemer 241 Polarimeter ( $\lambda=589 \mathrm{~nm}, 1 \mathrm{dm}$ cell). High resolution mass spectra were recorded on an IonSpec FTMS mass spectrometer with a DHB-matrix.

## Typical experimental procedure for one-step proline-catalyzed asymmetric

 synthesis of allose 1. A solution of benzyloxyacetaldehyde ( 2 mmol ) and proline ( 10 mol $\%$, the e.e of the proline was varied according to Figure 1) in DMF ( 2 mL ) was stirred at room temperature for 2 days. The reaction was quenched by extraction. The combined aqueous layers were back-extracted with 3 portions of EtOAc. The combined organic layers were dried over anhydrous $\mathrm{MgSO}_{4}$, which was subsequently removed by filtration. Next, the solvent was removed under reduced pressure following purification of the crude product mixture by silica-gel column chromatography (EtOAc:pentane-mixtures or toluene:EtOAc mixtures) to afford the desired tetrose and protected allose 1. Remaining starting material was reused in a second reaction sequence to further improve the yield.

2, 4-Benzyl-O-D-erythrose: ${ }^{1} \mathrm{H}-\mathrm{NMR}\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta(\mathrm{ppm}): 3.62(\mathrm{~d}, J=5.2 \mathrm{~Hz}, 2 \mathrm{H})$, 3.92 (dd, $J=5.6,2.0 \mathrm{~Hz}, 1 \mathrm{H}), 4.13(\mathrm{~m}, 1 \mathrm{H}), 4.51(\mathrm{~d}, J=4.8 \mathrm{~Hz}, 2 \mathrm{H}), 4.55(\mathrm{~d}, J=11.6$ $\mathrm{Hz}, 1 \mathrm{H}), 4.72(\mathrm{~d}, J=12.0 \mathrm{~Hz}, 1 \mathrm{H}), 7.30(\mathrm{~m}, 10 \mathrm{H}), 9.71(\mathrm{~d}, J=2 \mathrm{~Hz}, 1 \mathrm{H}) ;{ }^{13} \mathrm{C}-\mathrm{NMR}(100$ $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta(\mathrm{ppm}): 69.6,70.6,73.0,73.2,83.5,127.6,17.8,127.9,128.0,128.1$, 128.2, 136.8, 137.4, 201.8; $[\alpha]_{\mathrm{D}}{ }^{25}=-8.1\left(c=3.4, \mathrm{CHCl}_{3}\right) ;$ MALDI-TOF MS: 323.1261; $\mathrm{C}_{19} \mathrm{H}_{20} \mathrm{O}_{4}\left(\mathrm{M}+\mathrm{Na}^{+}\right.$: calcd 323.1259). The enantiomeric excess of the tetrose was determined by in situ reduction with $\mathrm{NaBH}_{4}$ at $0{ }^{\circ} \mathrm{C}$ to furnish the corresponding diol. HPLC (Daicel Chiralpak AD, hexanes $/ i-\operatorname{PrOH}=96: 4$, flow rate $0.5 \mathrm{~mL} / \mathrm{min}, \lambda=254$ $\mathrm{nm})$ : major isomer: $\mathrm{t}_{\mathrm{R}(\text { anti) }}=82.33 \mathrm{~min}$; minor isomer: $\mathrm{t}_{\mathrm{R}(\text { anti) }}=91.55 \mathrm{~min}$; major isomer: $\mathrm{t}_{\mathrm{R}(\mathrm{syn})}=97.08 \mathrm{~min}$; minor isomer: $\mathrm{t}_{\mathrm{R}(\mathrm{syn})}=98.56 \mathrm{~min}$.

2, 4, 6-tri- $O$-benzyl-allose 2 ( $\alpha: \beta-1: 2$ ): ${ }^{1} \mathrm{H}-\mathrm{NMR}\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right.$ ) $\beta$-anomer: $\delta$ (ppm) $3.18(\mathrm{dd}, 1 \mathrm{H}), 3.51(\mathrm{~m}, 1 \mathrm{H}), 3.61-3.81(\mathrm{~m}, 2 \mathrm{H}), 4.01(\mathrm{~m}, 1 \mathrm{H}), 4.28(\mathrm{t}, 1 \mathrm{H}), 4.18-4.86(\mathrm{~m}$, $6 \mathrm{H}), 5.18(\mathrm{~d}, J=8.8 \mathrm{~Hz}, 1 \mathrm{H}), 7.28(\mathrm{~m}, 15 \mathrm{H}) ; \alpha$-anomer: $\delta(\mathrm{ppm}) 3.41(\mathrm{~m}, 0.5 \mathrm{H}), 3.61-$ $3.90(\mathrm{~m}, 1 \mathrm{H}), 4.19(\mathrm{~m}, 0.5 \mathrm{H}), 4.18-4.86(\mathrm{~m}, 3 \mathrm{H}), 5.23(\mathrm{bs}, 0.5 \mathrm{H}), 7.28(\mathrm{~m}, 7.5 \mathrm{H}) ;{ }^{13} \mathrm{C}-$ NMR ( $100 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\alpha$ - and $\beta$ - anomer: $\delta$ (ppm) 65.1, 67.1, 68.6, 68.8, 69.4, 70.8, $71.0,71.9,72.0,73.4,73.8,92.5,100.3,125.6,128.2,128.3,128.5,128.6,128.8,138.1$, 138.2. MALDI-TOF MS: 473.1943; $\mathrm{C}_{27} \mathrm{H}_{33} \mathrm{O}_{6}\left(\mathrm{M}+\mathrm{Na}^{+}\right.$: calcd 473.194). The allose $\mathbf{1}$ was peracetylated according to the general procedure and the enantiomeric excess determined.

General determination of the enantiomeric excesses of allose 2: The hexose ( 180 mg ) was dissolved in $2 \mathrm{~mL} \mathrm{CH} \mathrm{Cl}_{2}$ followed by addition of excess acetic anhydride and a catalytic amount of DMAP ( $0.1 \mathrm{~mol} \%$ ). The reaction was stirred at room temperature until all the hexose 2 had been acetylated as determined by TLC analyses. The reactions were quenched by extraction. The combined aqueous layers were back-extracted with 3 portions of EtOAc. The combined organic layers were dried over anhydrous $\mathrm{Na}_{2} \mathrm{SO}_{4}$, which was subsequently removed by filtration. Next, the solvent was removed under reduced pressure following purification of the crude product mixture by silica-gel column chromatography (EtOAc:pentane-mixtures) to quantitatively afford the desired 1, 3-di-acetyl-2, 4, 6-tri-O-benzyl-hexoses. Next, the hexoses were dissolved in MeOH and hydrogenated in the presence of a catalytic amount of $\mathrm{Pd} / \mathrm{C}(0.1 \mathrm{~mol} \%)$. After 17 h the catalyst was filtered off and the solvent removed under reduced pressure. The crude benzyl-free hexoses were immediately acetylated vide infra to furnish the pentaacetylated sugars. All data of the isolated pure penta- $O$-acetylated $\beta$-anomers of hexose 2 was in accordance with $1,2,3,4,6$-Penta- $O$-acetyl- $\beta$-L-allopyranoside. ${ }^{[1]}$

1, 2, 3, 4, 6-Penta-O-acetyl- $\beta$-L-allopyranoside: ${ }^{1} \mathrm{H}-\mathrm{NMR}\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta(\mathrm{ppm})$ : $2.00(\mathrm{~s}, 3 \mathrm{H}), 2.01(\mathrm{~s}, 3 \mathrm{H}), 2.07(\mathrm{~s}, 3 \mathrm{H}), 2.11(\mathrm{~s}, 3 \mathrm{H}), 2.16(\mathrm{~s}, 3 \mathrm{H}), 4.20(\mathrm{~m}, 3 \mathrm{H}), 4.99(\mathrm{~m}$, $2 \mathrm{H}), 5.69(\mathrm{t}, J=2.9 \mathrm{~Hz}, 1 \mathrm{H}), 6.00(\mathrm{~d}, J=8.8 \mathrm{~Hz}, 1 \mathrm{H}),{ }^{13} \mathrm{C}-\mathrm{NMR}\left(100 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta$ (ppm): 20.4, 20.6, 20.9, 21.1, 61.8, 65.5, 68.1, 68.2, 71.0, 90.0, 169.0, 169.6, 170.1, 170.3, 170.9; GC: (CP-Chirasil-Dex CB); $\mathrm{T}_{\text {inj }}=250^{\circ} \mathrm{C}$, $\mathrm{T}_{\text {det }}=275{ }^{\circ} \mathrm{C}$, flow $=1.8$ $\mathrm{mL} / \mathrm{min}, \mathrm{t}_{\mathrm{i}}=100^{\circ} \mathrm{C}(10 \mathrm{~min}), \mathrm{t}_{\mathrm{f}}=200^{\circ} \mathrm{C}\left(1.5^{\circ} \mathrm{C} / \mathrm{min}\right)$ : major isomer: $\mathrm{t}_{\mathrm{R}}=62.72 \mathrm{~min}$;

[^0]Direct amino acid catalyzed synthesis of $\mathbf{4}$. The cross-aldol adduct $\mathbf{3}$ was synthesized according to MacMillan's and ours procedures utilizing D,L-proline ( $10 \mathrm{~mol} \%$ ) as the catalyst. ${ }^{[2]}$ The racemic cross-aldol product 3 was dissolved in 1 mL of DMF, with 10 $\mathrm{mol} \%$ of D-proline. Next, a suspension of propionaldehyde (2 equivalents) in 2 mL DMF was added slowly over the course of 16 h to the reaction mixture at $4{ }^{\circ} \mathrm{C}$. Next, the solution was allowed to react at room temperature and stirred for 24 h . The reaction was quenched by extraction. The combined aqueous layers were back-extracted with 3 portions of EtOAc. The combined organic layers were dried over anhydrous $\mathrm{MgSO}_{4}$, which was subsequently removed by filtration. Next, the solvent was removed under reduced pressure following purification of the crude product mixture by silica-gel column chromatography (EtOAc:pentane-mixtures) to afford the desired hexose 4 together with the starting aldehyde 3. The remaining racemic $\beta$-hydroxyaldehyde $\mathbf{3}$ was reused in a second cross-aldol addition to further improve the yield.
