## Experimental

General considerations. Unless specified otherwise, all manipulations were performed under an argon atmosphere using standard Schlenk line or glovebox techniques. Toluene, ethyl ether, $\mathrm{C}_{6} \mathrm{D}_{6}$, THF, pentane, were dried over $\mathrm{NaK} / \mathrm{Ph}_{2} \mathrm{CO} / 18$ -crown-6, distilled or vacuum transferred and stored over molecular sieves in an Ar-filled glovebox. Compounds $[(\mathrm{COD}) \mathrm{RhCl}]_{2}{ }^{1}$, $\mathbf{1 a} \mathbf{a} \mathbf{c}$ and $\mathbf{2 a - c} \mathbf{c}^{2,3}$ were prepared as described previously. All other chemicals were used as received from commercial vendors. NMR spectra were recorded on a Varian iNova $400\left({ }^{1} \mathrm{H}\right.$ NMR, $399.755 \mathrm{MHz} ;{ }^{13} \mathrm{C}$ NMR, 100.518 MHz; ${ }^{31}$ P NMR, 161.822 MHz.) spectrometer. Chemical shifts are reported in $\delta$ (ppm). For ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra, the residual solvent peak was used as an internal reference. ${ }^{31} \mathrm{P}$ NMR spectra were referenced externally using $85 \% \mathrm{H}_{3} \mathrm{PO}_{4}$ at $0 \mathrm{ppm} .{ }^{19} \mathrm{~F}$ NMR was referenced externally to $1.0 \mathrm{M} \mathrm{CF}_{3} \mathrm{COOH}$ in $\mathrm{CDCl}_{3}$ at -78.5 ppm . Gas chromatography/mass spectra (GC/MS) were recorded on a Hewlett Packard G1800C

GCD System (GCD Plus Gas Chromatograph Electron Ionization Detector) employing HP-5MS from Agilent Technologies ( 30 m (column length) 0.25 mm (i.d.)). FT-IR spectra were recorded on Perkin Elmer spectrometer $\mathrm{BX}_{2}$ by using v 2.00 software.

NMR integration. Our empirical observations lead us to utilize a $\pm 3 \%$ error for the product fractions calculated from NMR integrations. Thus, all values for percent fractions should be taken with a $\pm 3 \%$ margin of error. This probably varies depending on what the ratios are exactly. A determination of a $98: 2$ ratio is more accurate in absolute terms than a $50: 50$ determination. Cases where the integration error is assumed to be larger are so noted.

( ${ }^{\mathrm{Me}} \mathbf{P N P}$ ) $\mathbf{R h H}_{\mathbf{2}}$ (3b). Method 1. In a Teflon gas tight round bottom flask was combined the following: $\mathbf{1 b}(0.718 \mathrm{~g}, 1.61 \mathrm{mmol}),[(\mathrm{COD}) \mathrm{RhCl}]_{2}(0.400 \mathrm{~g}, 1.61 \mathrm{mmol}$ Rh ), and 20 mL of fluorobenzene. The solution was stirred for 10 minutes and then was evaporated to dryness in vacuo. The residue was placed into a $70^{\circ} \mathrm{C}$ oil bath for 4 h . The resulting green solid ( $0.793 \mathrm{~g}, 1.36 \mathrm{mmol}$ ) was dissolved in 20 mL of THF and 20 mL of 2-propanol. $\mathrm{NaBH}_{4}(0.514 \mathrm{~g}, 13.6 \mathrm{mmol})$ was added and the mixture was stirred for 1.5 h , during which time the color of solution changed from deep green to orange-brown. The solution was evaporated to dryness under vacuum, extracted with ether and filtered through a pad of Celite and then through a plug of silica gel. The volatiles were removed from the filtrate in vacuo and the residue was recrystallized from diethyl ether to afford pure product. Yield after recrystallization: $0.38 \mathrm{~g}(45 \%)$.

Method 2. 3b can also be prepared from ( ${ }^{\mathrm{Me}} \mathrm{PNP}$ )RhHCl $(\mathbf{S 1})^{3}$ as follows. To 522 mg of $\mathbf{S} 1(0.92 \mathrm{mmol})$ in 20 mL of $2-$ propanol was added 0.75 g of $\mathrm{NaBH}_{4}(7.9 \mathrm{mmol})$ at room temperature. This mixture was heated at $60{ }^{\circ} \mathrm{C}$ for 4 h ; the
 solvent was then removed in vacuo. The residue was extracted with toluene several times and filtered through a suction funnel. The filtrates were combined and the solvent was evaporated to dryness to afford product that was $>95 \%$ pure by NMR.
